On-Chip Networks I: Topology/Flow Control

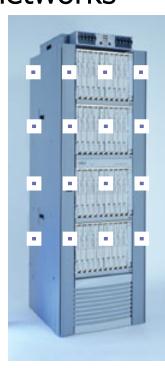

Ryan Lee
Computer Science & Artificial Intelligence Lab
M.I.T.

History: From interconnection networks to on-chip networks

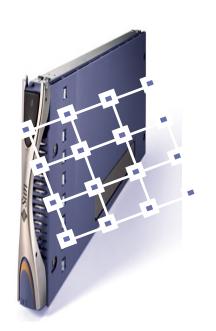

Box-to-box networks

Board-to-board networks

Chip-to-chip networks

On-chip networks

Multi-Chip: Supercomputers, Data Centers, Internet Routers, Servers On-Chip: Servers, Laptops, Phones, HDTVs, Access routers

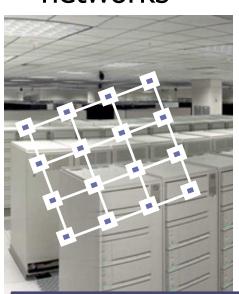

History: From interconnection networks to on-chip networks

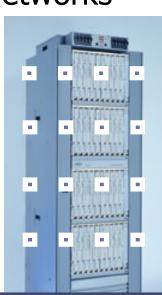

Box-to-box networks

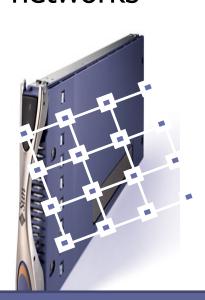

Board-to-board networks

Chip-to-chip networks

On-chip networks

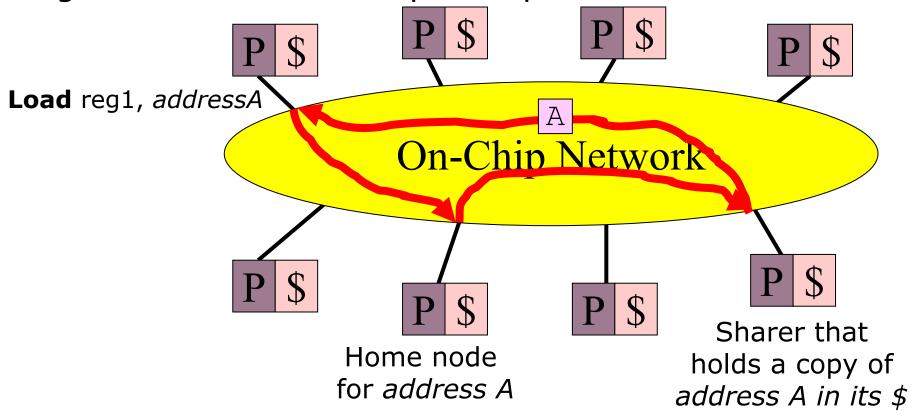

Focus on on-chip networks connecting caches in shared-memory processors

Multi-Chip: Supercomputers, Data Centers, Internet Routers, Servers On-Chip: Servers, Laptops, Phones, HDTVs, Access routers

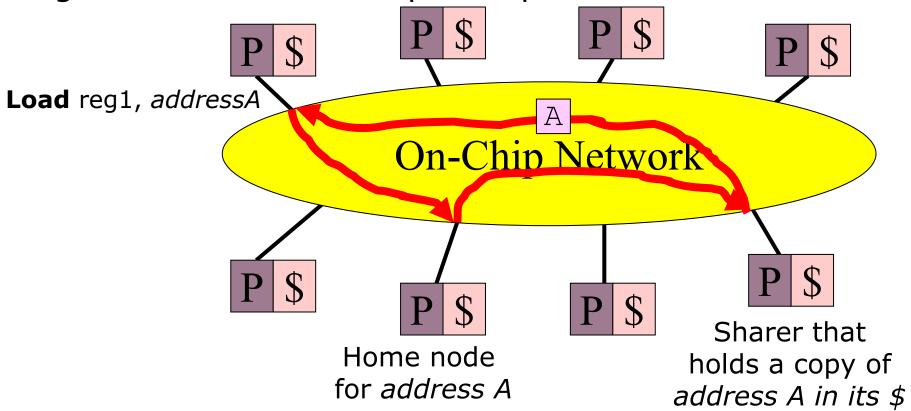

What's an on-chip network?

E.g. Cache-coherent chip multiprocessor

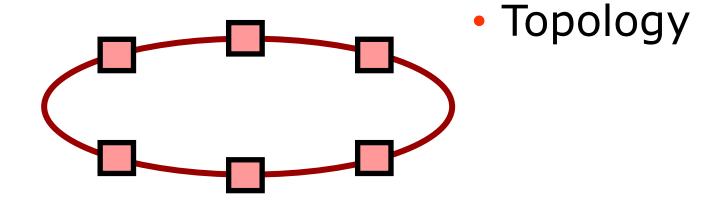

What's an on-chip network?

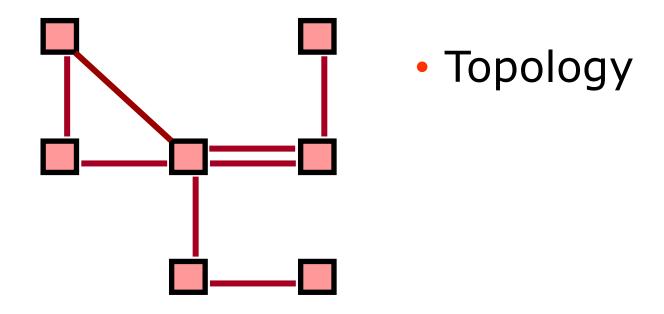

E.g. Cache-coherent chip multiprocessor

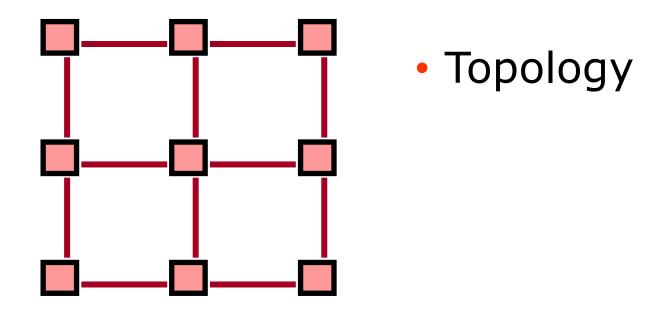

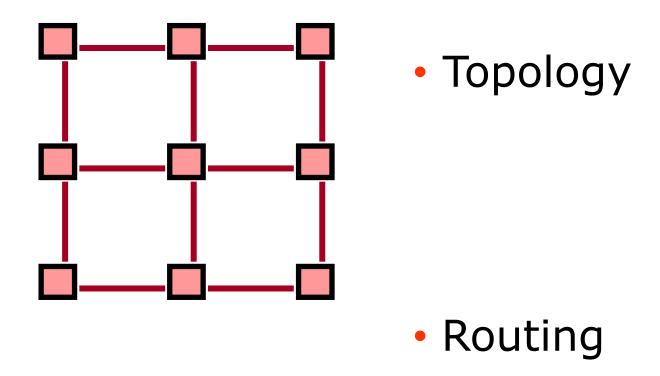

Network transports cache coherence messages and cache lines between processor cores

Interconnection Network Architecture

- *Topology*: How to connect the nodes up? (processors, memories, router line cards, ...)
- Routing: Which path should a message take?
- Flow control: How is the message actually forwarded from source to destination?
- Router microarchitecture: How to build the routers?
- Link microarchitecture: How to build the links?

Topology

Topological Properties

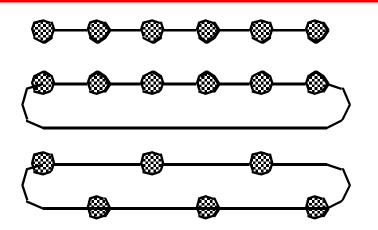

Diameter

• Average Distance

• Bisection Bandwidth

Topological Properties

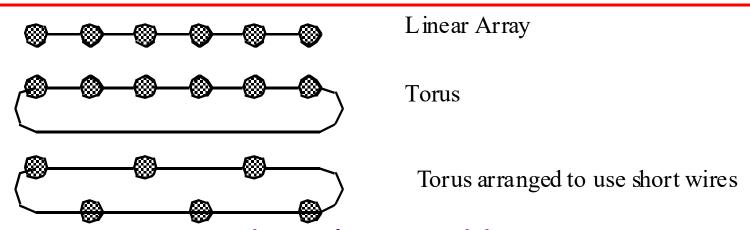

- Routing Distance number of links on route
- Diameter maximum routing distance
- Average Distance
- A network is *partitioned* by a set of links if their removal disconnects the graph
- Bisection Bandwidth is the bandwidth crossing a minimal cut that divides the network in half

Linear Array

Torus

Torus arranged to use short wires

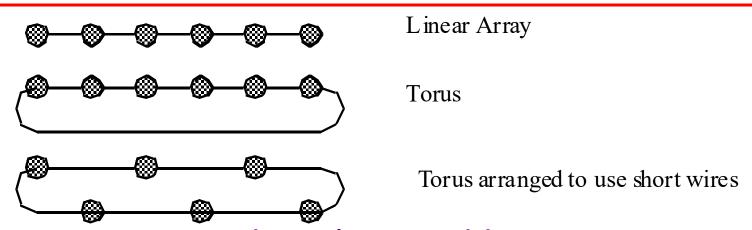

Route A -> B given by relative address R = B-A

Linear Array Ring (1-D Torus)

Diameter?

Average distance?

- Torus Examples:
 - FDDI, SCI, FiberChannel Arbitrated Loop, Intel Xeon

Route A -> B given by relative address R = B-A

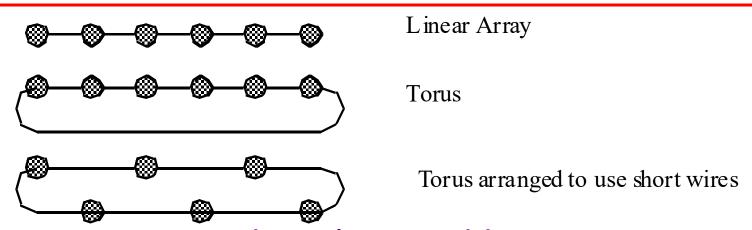

Linear Array Ring (1-D Torus)

N-1

Diameter?

Average distance?

- Torus Examples:
 - FDDI, SCI, FiberChannel Arbitrated Loop, Intel Xeon

Route A -> B given by relative address R = B-A

Linear Array Ring (1-D Torus)

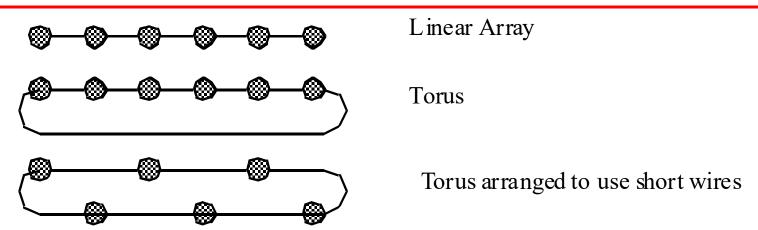

Diameter?

N-1

Average distance?

N/3-1/(3N)

- Torus Examples:
 - FDDI, SCI, FiberChannel Arbitrated Loop, Intel Xeon

Route A -> B given by relative address R = B-A

Linear Array Ring (1-D Torus)

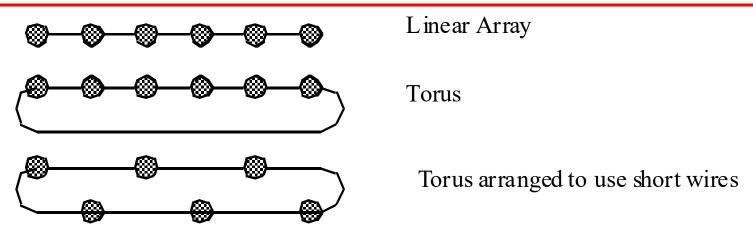

Diameter?

N-1

Average distance?

N/3-1/(3N)

- Torus Examples:
 - FDDI, SCI, FiberChannel Arbitrated Loop, Intel Xeon

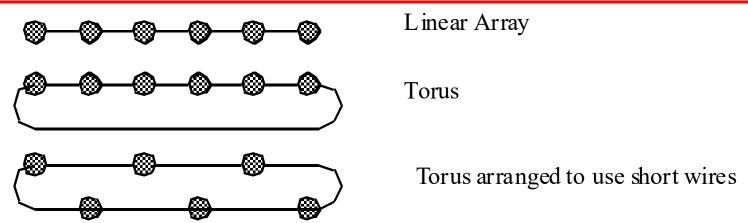

Route A -> B given by relative address R = B-A

Linear Array Ring (1-D Torus)

N-1 N/2 (if even N)

Average distance? N/3-1/(3N)

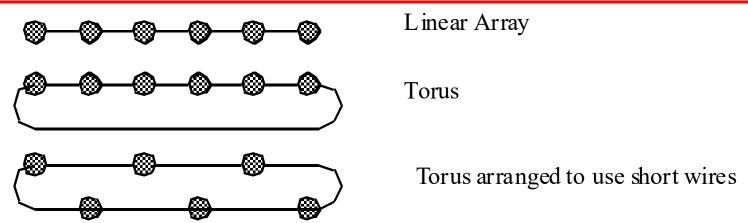

- Torus Examples:
 - FDDI, SCI, FiberChannel Arbitrated Loop, Intel Xeon

Route A -> B given by relative address R = B-A

```
Linear Array Ring (1-D Torus)
Diameter?
N-1
N/2 (if even N)
Average distance?
N/3-1/(3N)
N/4 (if even N)
Bisection bandwidth?
1
```

- Torus Examples:
 - FDDI, SCI, FiberChannel Arbitrated Loop, Intel Xeon

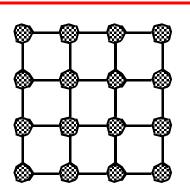

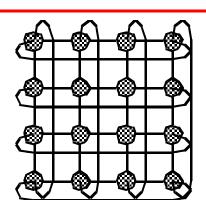

Route A -> B given by relative address R = B-A

	Linear Array	Ring (1-	D Torus)
Diameter?	N-1	N/2	(if even N)
Average distance?	N/3-1/(3N	I) N/4	(if even N)
Bisection bandwidt	h? 1	2	

- Torus Examples:
 - FDDI, SCI, FiberChannel Arbitrated Loop, Intel Xeon

Multidimensional Meshes and Tori

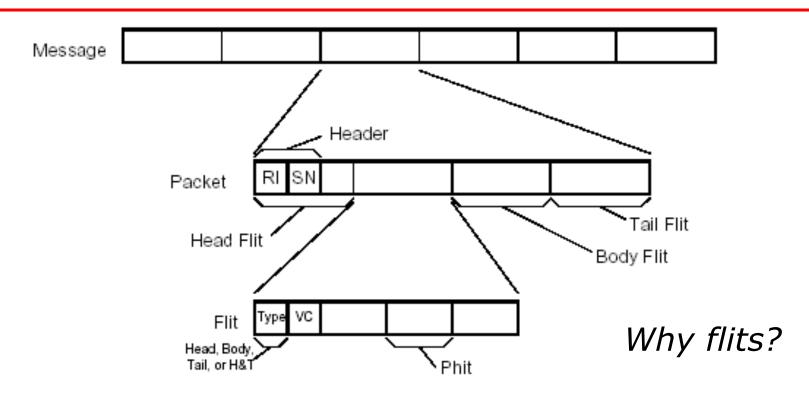

- d-dimensional array
 - $-n = k_{d-1} \times ... \times k_0$ nodes
 - described by *d*-vector of coordinates $(i_{d-1}, ..., i_0)$
- d-dimensional k-ary mesh: N = k^d
 - $k = d\sqrt{N}$
 - described by d-vector of radix k coordinate
- d-dimensional k-ary torus (or k-ary d-cube)

Routing & Flow Control Overview

Messages, Packets, Flits, Phits

Packet: Basic unit of routing and sequencing

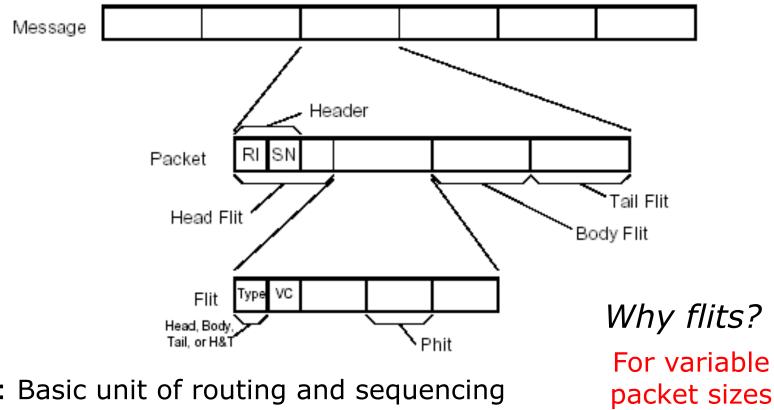

- Limited size (e.g. 64 bits – 64 KB)

Flit (flow control digit): Basic unit of bandwidth/storage allocation

- All flits in packet follow the same path

Phit (physical transfer digit): data transferred in single clock

Messages, Packets, Flits, Phits

Packet: Basic unit of routing and sequencing

- Limited size (e.g. 64 bits – 64 KB)

Flit (flow control digit): Basic unit of bandwidth/storage allocation

- All flits in packet follow the same path Phit (physical transfer digit): data transferred in single clock

Routing vs Flow Control

- Routing algorithm chooses path that packets should follow to get from source to destination
- Flow control schemes allocate resources (buffers, links, control state) to packets traversing the network

- Our approach: Bottom-up
 - Today: Flow control, assuming routes are set
 - Next lecture: Routing algorithms

Properties of Routing Algorithms

Deterministic/Oblivious

Route determined by (source, dest), not intermediate state (i.e. traffic)

Adaptive

Route influenced by traffic along the way

Minimal

Only selects shortest paths

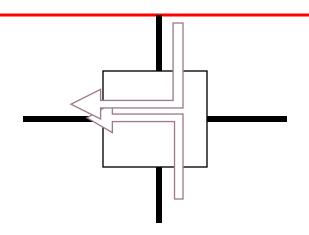

Deadlock-free

No traffic pattern can lead to a situation where no packets move forward

(more in next lecture)

Flow Control

Contention

- Two packets trying to use the same link at the same time
 - Limited or no buffering
- Problem arises because we are sharing resources
 - Sharing bandwidth and buffers

Flow Control Protocols

Bufferless

- Circuit switching
- Dropping
- Misrouting

Buffered

- Store-and-forward
- Virtual cut-through
- Wormhole
- Virtual-channel

Flow Control Protocols

Bufferless

- Circuit switching
- Dropping
- Misrouting

Buffered

- Store-and-forward
- Virtual cut-through
- Wormhole
- Virtual-channel

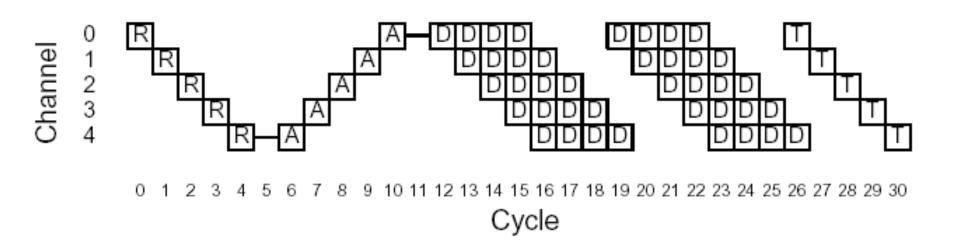

Complexity & Efficiency

Circuit Switching

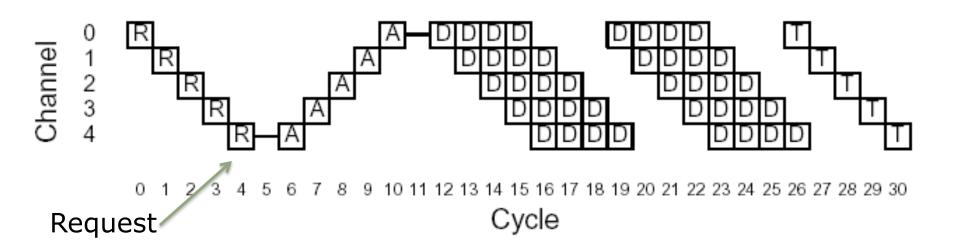

Form a circuit from source to dest

- Probe to set up path through network
- Reserve all links
- Data sent through links

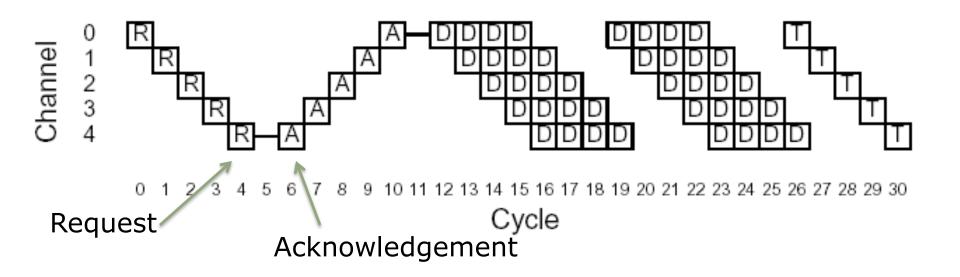

Bufferless

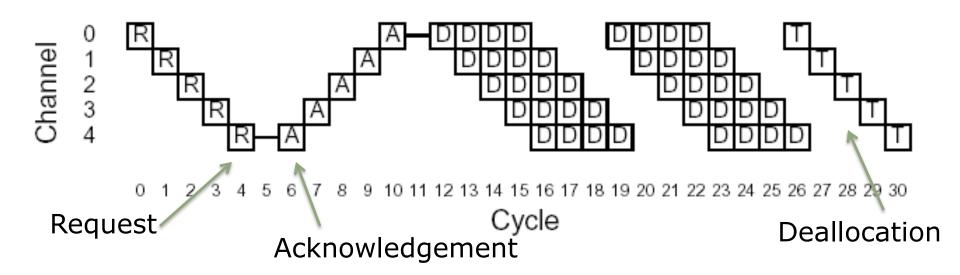

- Why is this good?
- Why is it not?

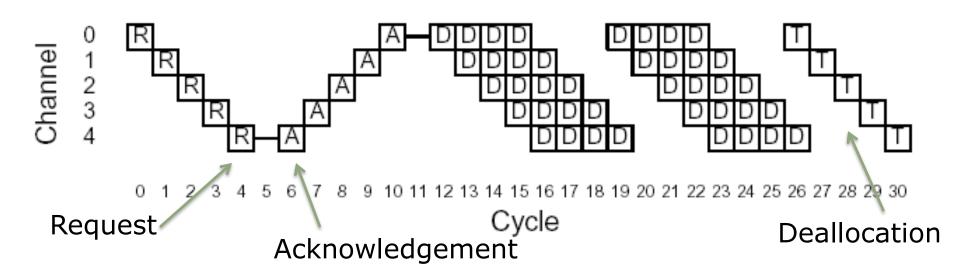

- Why is this good?
- Why is it not?

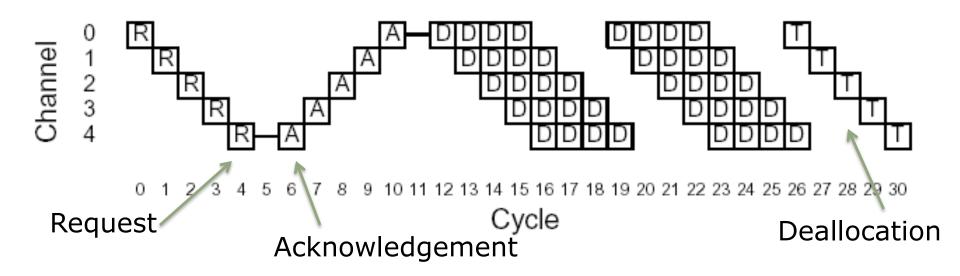

- Why is this good?
- Why is it not?

- Why is this good?
- Why is it not?

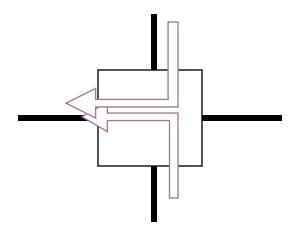

- Why is this good? Simple to implement
- Why is it not?

- Why is this good? Simple to implement
- Why is it not? Wasteful, 3x latency for short packets

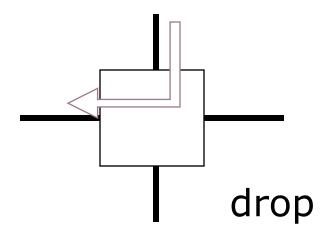

Speculative Flow Control: Dropping

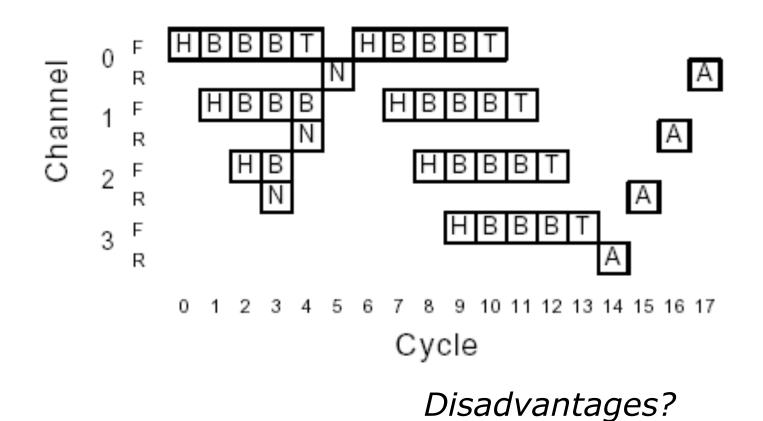

- If two things arrive and I don't have resources, drop one of them
- Flow control protocol on the Internet

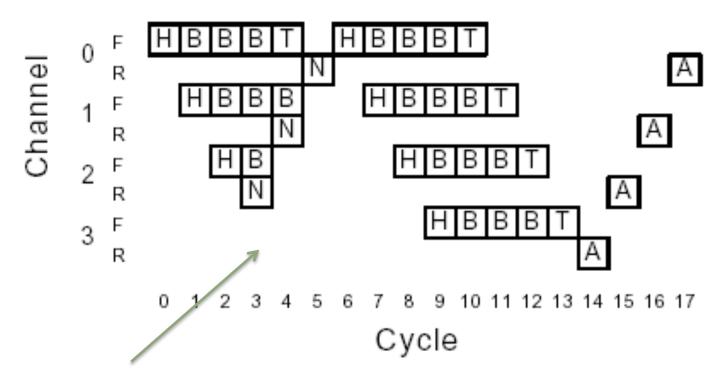

Speculative Flow Control: Dropping

- If two things arrive and I don't have resources, drop one of them
- Flow control protocol on the Internet

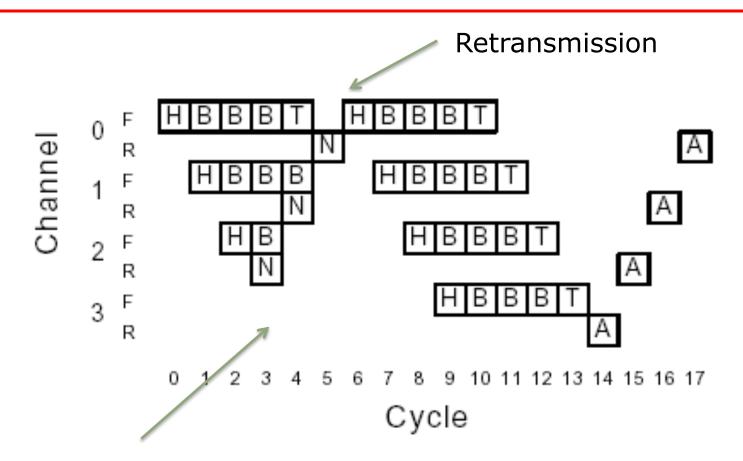

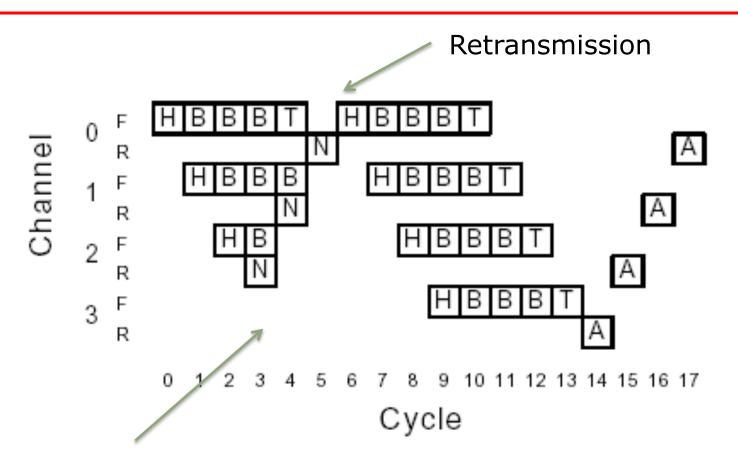

Unable to allocate channel 3

Disadvantages?

Unable to allocate channel 3

Disadvantages?

Unable to allocate channel 3

Disadvantages?

Poor tradeoff of traffic and buffering

 If only one message can enter the network at each node, and one message can exit the network at each node, the network can never be congested. Right?

 If only one message can enter the network at each node, and one message can exit the network at each node, the network can never be congested. Right?

Wrong! Multiple hops cause congestion

 If only one message can enter the network at each node, and one message can exit the network at each node, the network can never be congested. Right?

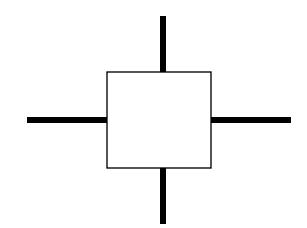

Wrong! Multiple hops cause congestion

- Philosophy behind misrouting: intentionally route away from congestion
- No need for buffering

 If only one message can enter the network at each node, and one message can exit the network at each node, the network can never be congested. Right?

Wrong! Multiple hops cause congestion

 If only one message can enter the network at each node, and one message can exit the network at each node, the network can never be congested. Right?

Wrong! Multiple hops cause congestion

 If only one message can enter the network at each node, and one message can exit the network at each node, the network can never be congested. Right?

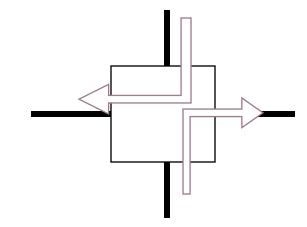

Wrong! Multiple hops cause congestion

- No need for buffering
- Problems?

 If only one message can enter the network at each node, and one message can exit the network at each node, the network can never be congested. Right?

Wrong! Multiple hops cause congestion

- No need for buffering
- Problems? Livelock: need to guarantee that progress is made

Buffered Routing

Link-level flow control:

– Given that you can't drop packets, how to manage the buffers? When can you send stuff forward, when not?

Metrics of interest:

- Throughput/Latency
- Buffer utilization (turnaround time)

- Naïve stall-based (on/off):
 - Can source send or not?

- Naïve stall-based (on/off):
 - Can source send or not?
- Sophisticated stall-based (credit-based):
 - How many flits can be sent to the next node?

- Naïve stall-based (on/off):
 - Can source send or not?
- Sophisticated stall-based (credit-based):
 - How many flits can be sent to the next node?
- Speculative (ack/nack):
 - Guess can always send, but keep copy
 - Resolve if send was successful (ack/nack)
 - On ack drop copy
 - On nack resend

Store-and-Forward (packet-based, no flits)

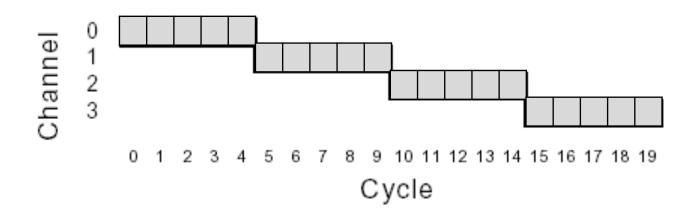

Strategy:

 Make intermediate stops and wait until the entire packet has arrived before you move on

Advantage:

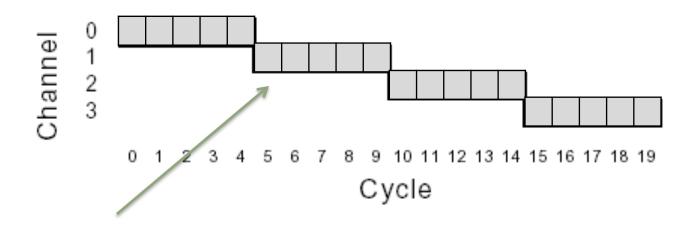

Other packets can use intermediate links

Time-space View: Store-and-Forward

- Buffering allows packet to wait for channel
- Drawback?

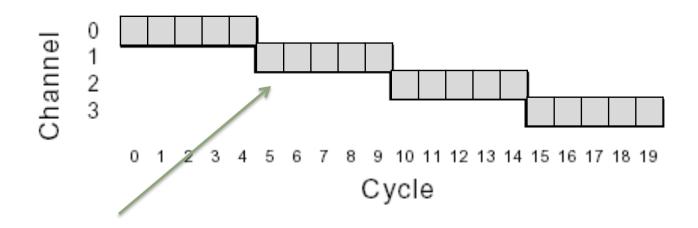

Time-space View: Store-and-Forward

Could be allocated at a much later time without packet dropping

- Buffering allows packet to wait for channel
- Drawback?

Time-space View: Store-and-Forward

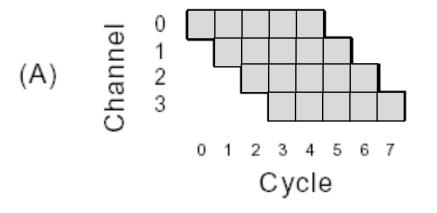

Could be allocated at a much later time without packet dropping

- Buffering allows packet to wait for channel
- Drawback?

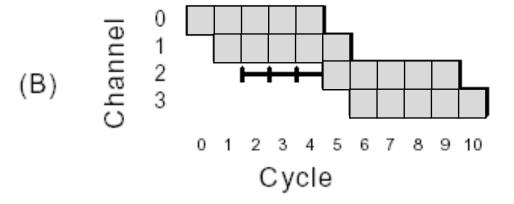

Serialization latency experienced at each hop/channel

Virtual Cut-through (packet-based)

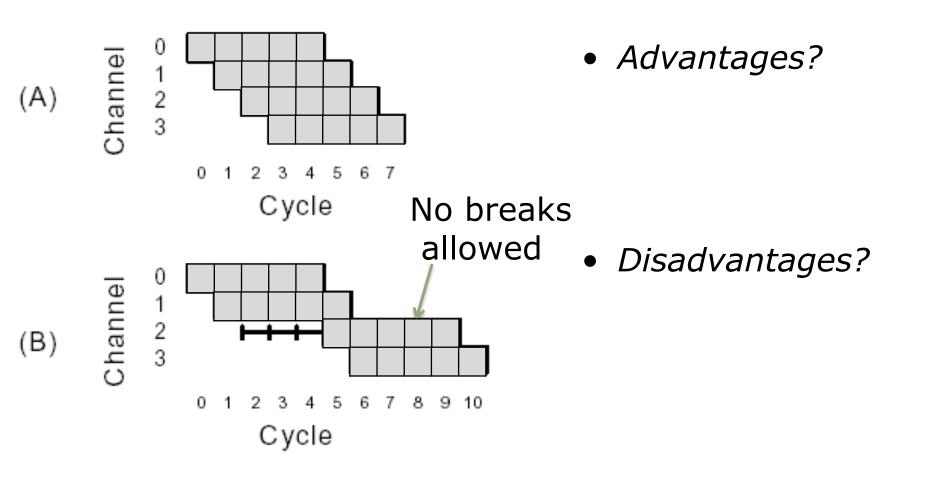

- Why wait till entire message has arrived at each intermediate stop?
- The head flit of the packet can dash off first
- When the head gets blocked, whole packet gets blocked at one intermediate node
- Used in Alpha 21364

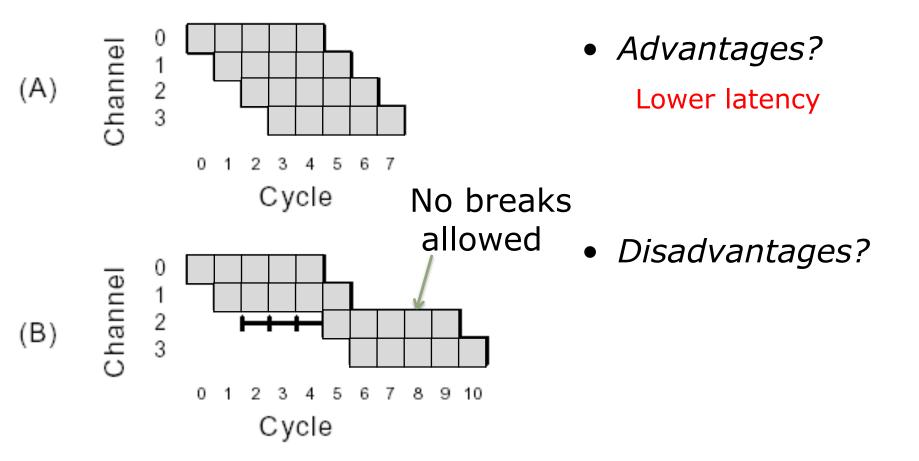

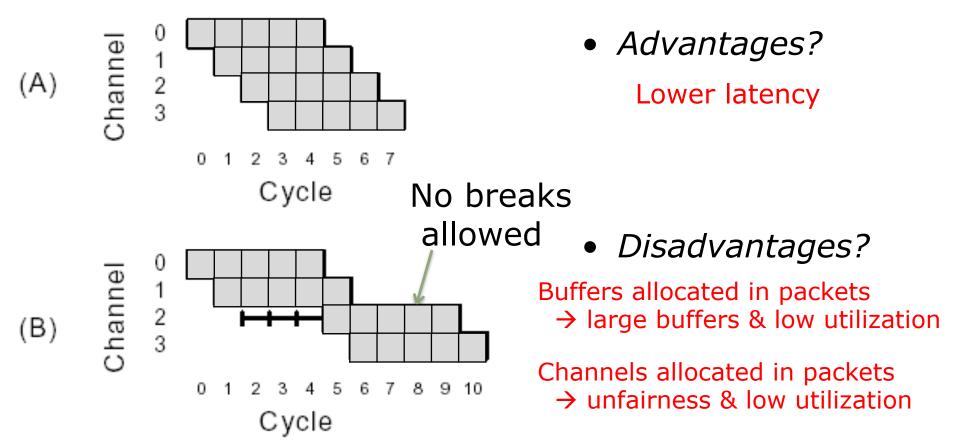

Advantages?

Disadvantages?

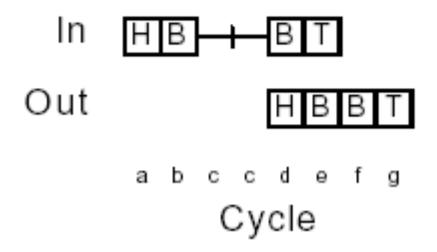

Flit-Buffer Flow Control: Wormhole

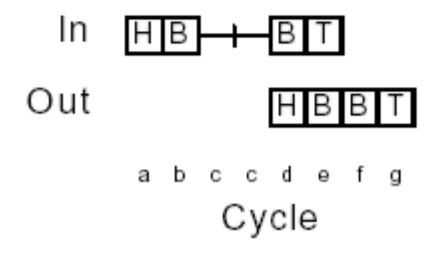

- When a packet blocks, just block wherever the pieces (flits) of the message are at that time.
- Operates like cut-through but with channel and buffers allocated to flits rather than packets
 - Channel state (virtual channel) allocated to packet so body flits can follow head flit

Time-space View: Wormhole

- Advantages?
- Disadvantages?

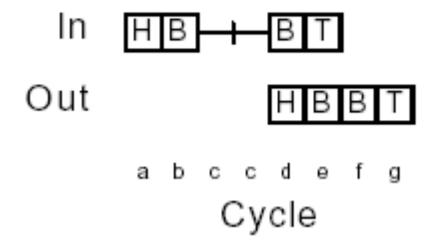

Time-space View: Wormhole

Advantages?

- Smaller amount of buffer space required
- Disadvantages?

Time-space View: Wormhole

Advantages?

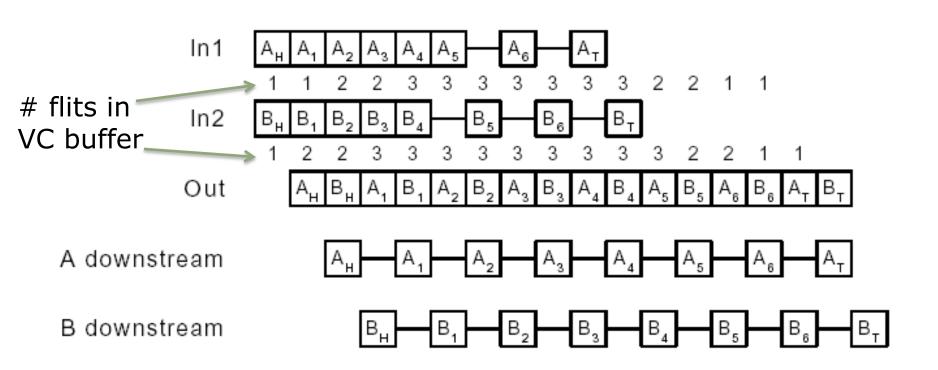

- Smaller amount of buffer space required
- Disadvantages?

May block a channel mid-packet, another packet cannot use bandwidth

Virtual-Channel (VC) Flow Control

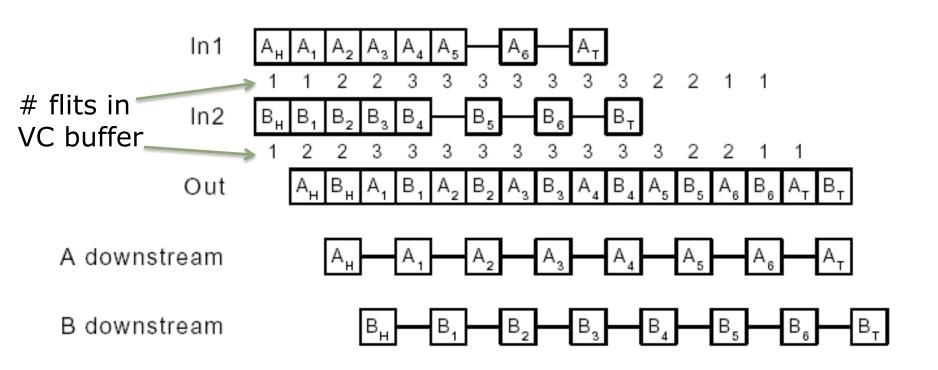

- When a message blocks, instead of holding on to links so others can't use them, hold on to virtual links
- Multiple queues in buffer storage
 - Like lanes on the highway
- Virtual channel can be thought of as channel state and flit buffers

Time-space View: Virtual-Channel

- Advantages?
- Disadvantages?

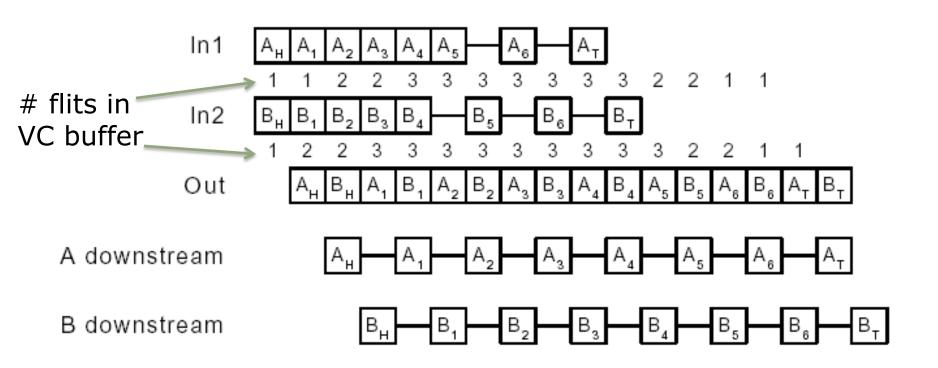

Time-space View: Virtual-Channel

Advantages?

- Significantly reduces blocking
- Disadvantages?

Time-space View: Virtual-Channel

Advantages?

- Significantly reduces blocking
- Disadvantages?

More complex router, fair VC allocation required

Thank you!
