Microcontrol Unit *Maurice Wilkes, 1954*

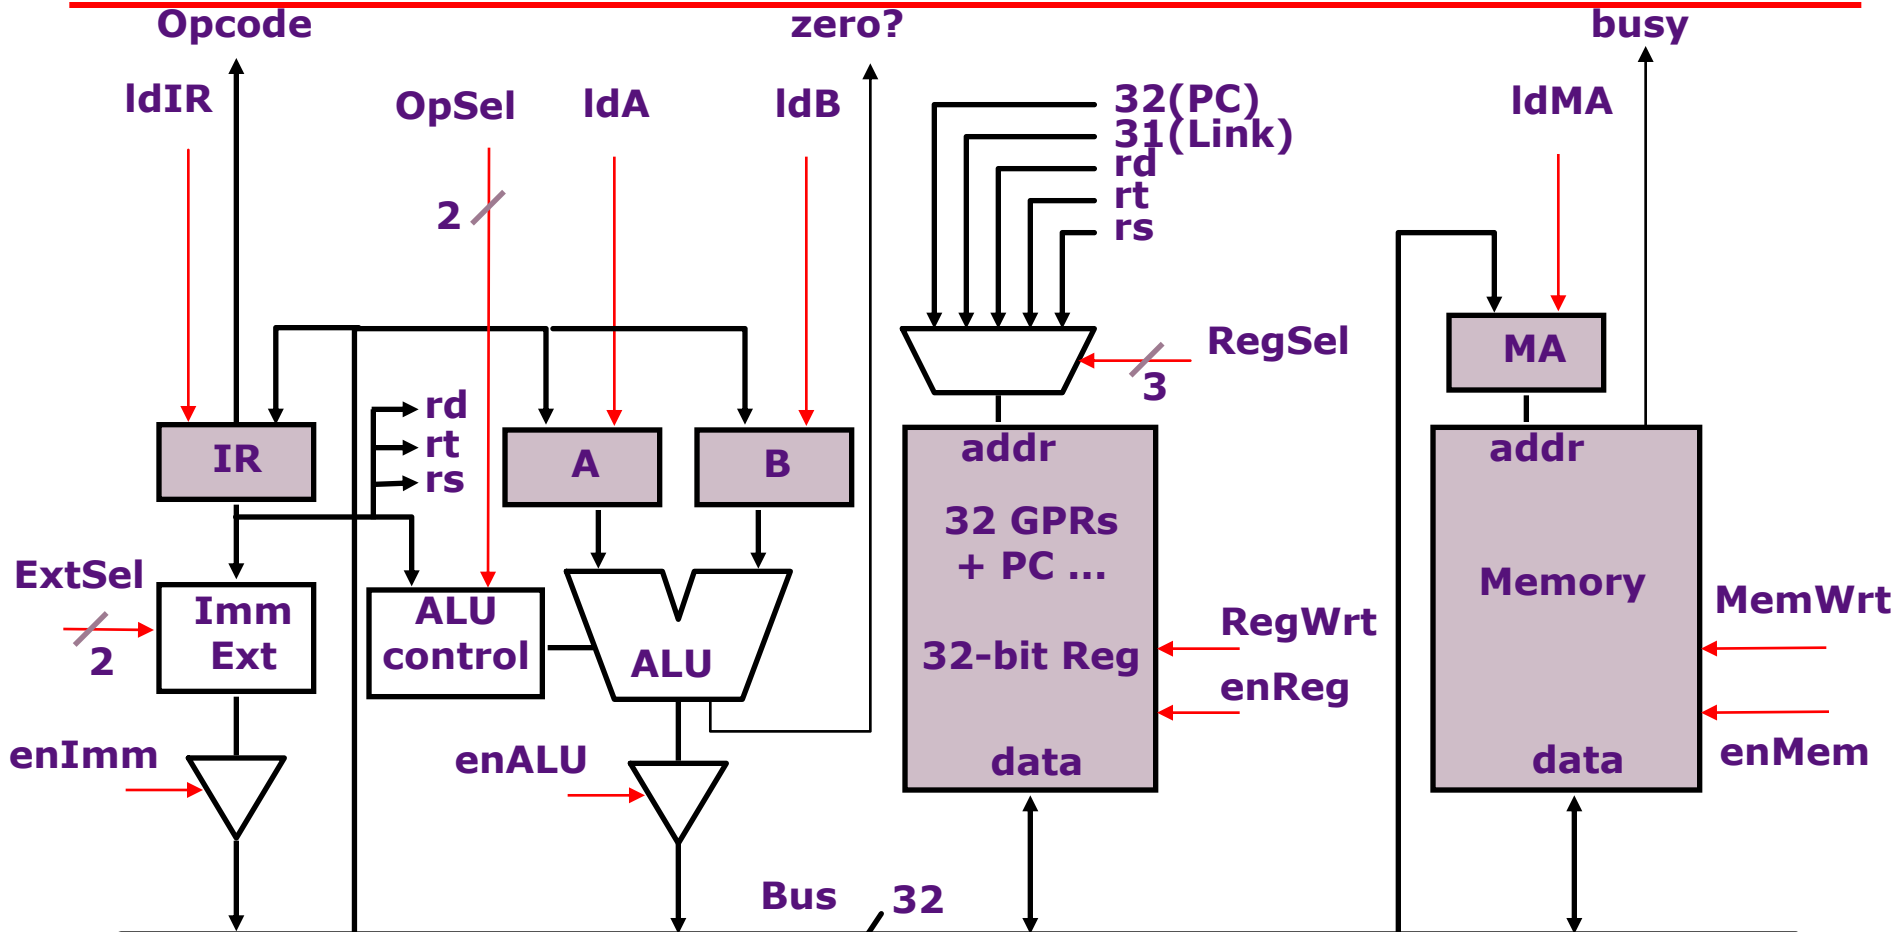

Embed the control logic state table in a memory array

Microcoded Microarchitecture

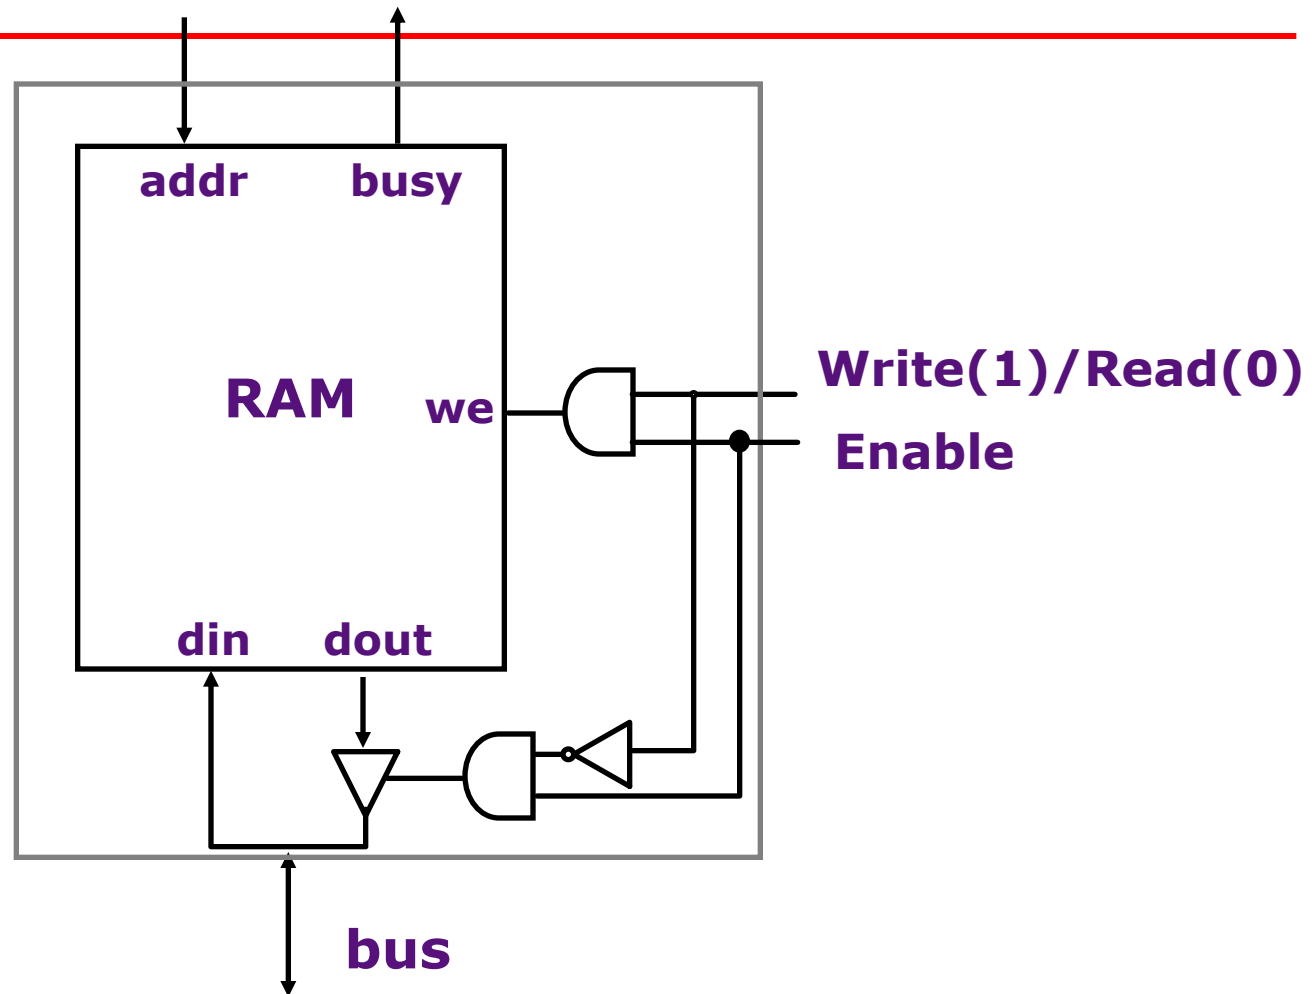

A Bus-based Datapath for MIPS

Microinstruction: register to register transfer (17 control signals)

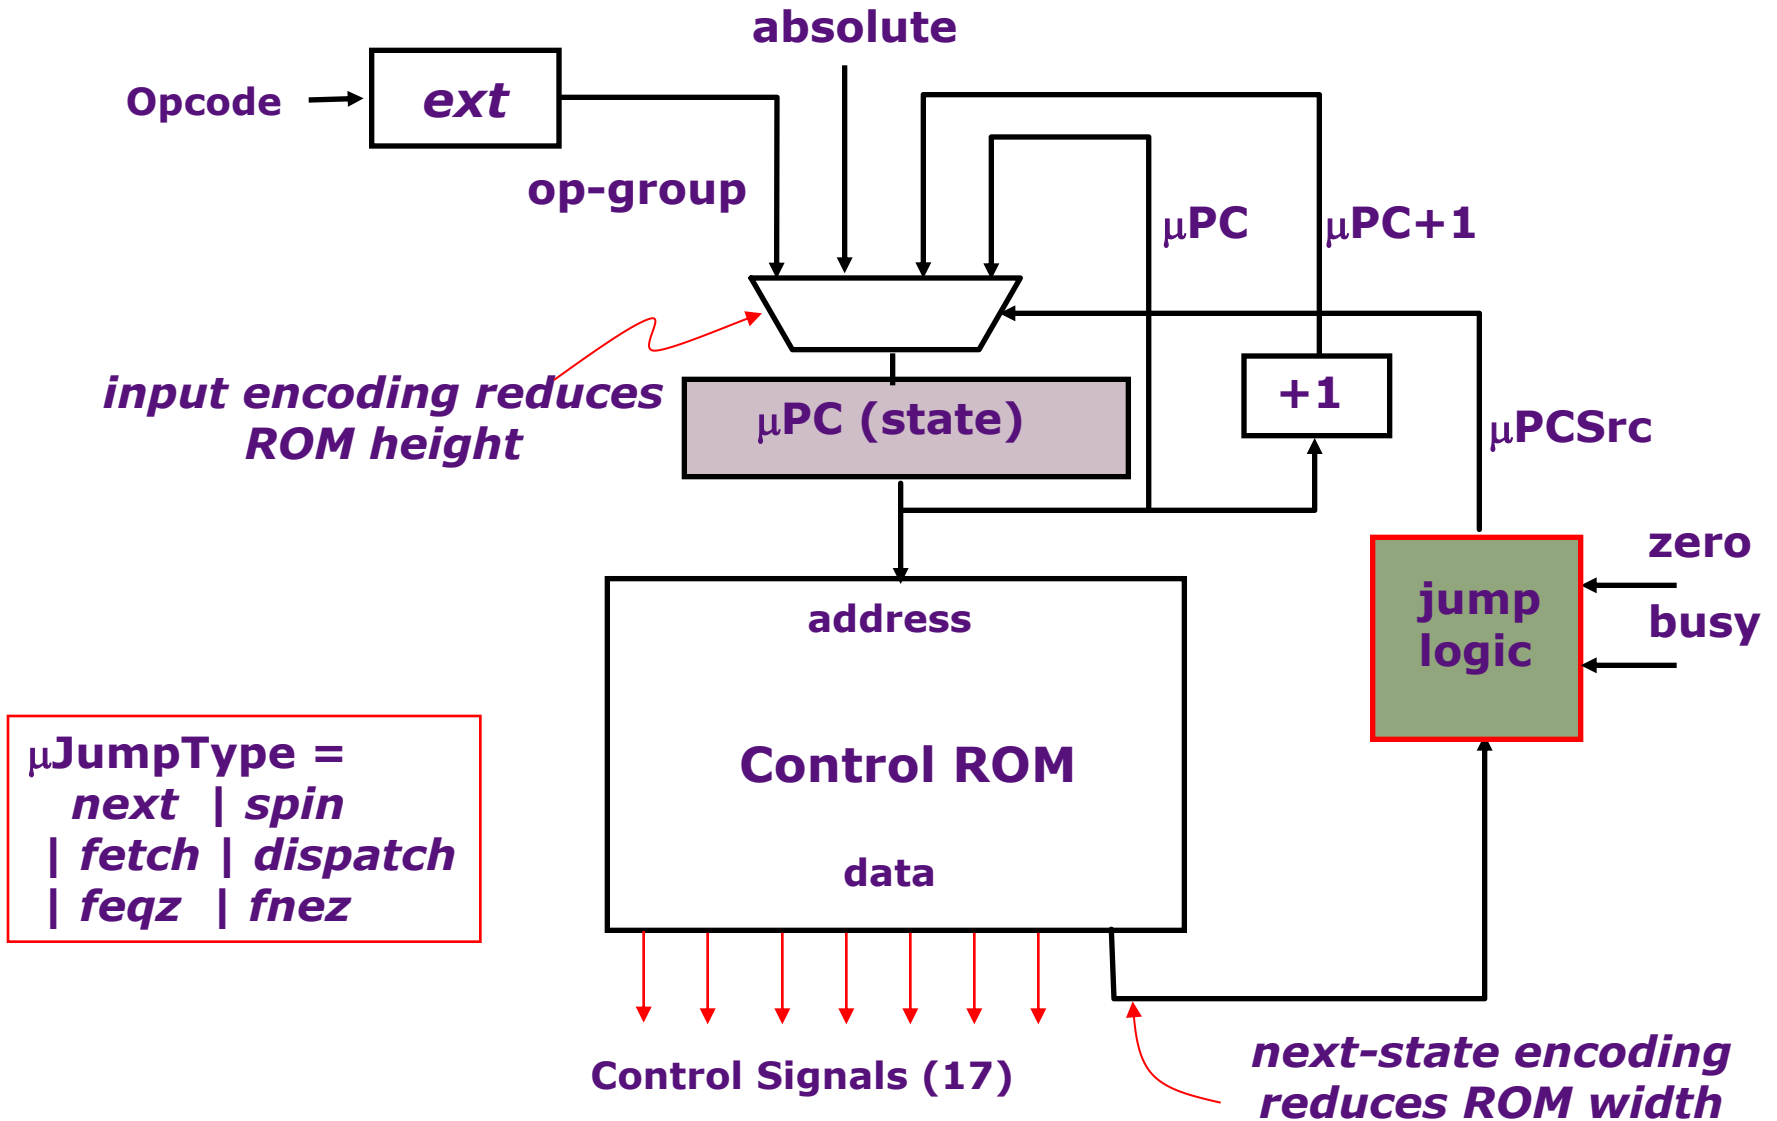

MA ← PC means RegSel = PC; enReg=yes; IdMA= yes
 B ← Reg[rt] means RegSel = rt; enReg=yes; IdB = yes

Memory Module

Assumption: Memory operates asynchronously and is slow as compared to Reg-to-Reg transfers

Microcode Controller

Jump Logic

$\mu\text{PCSrc} = \text{Case } \mu\text{JumpTypes}$

next \Rightarrow $\mu\text{PC}+1$

spin \Rightarrow **if (busy) then μPC else $\mu\text{PC}+1$**

fetch \Rightarrow **absolute**

dispatch \Rightarrow **op-group**

feqz \Rightarrow **if (zero) then absolute else $\mu\text{PC}+1$**

fnez \Rightarrow **if (zero) then $\mu\text{PC}+1$ else absolute**

Instruction Execution

Execution of a MIPS instruction involves

- 1. instruction fetch**
 - 2. decode and register fetch**
 - 3. ALU operation**
 - 4. memory operation (optional)**
 - 5. write back to register file (optional)**
- + the computation of the *next instruction* address**

Instruction Fetch

State	Control points	next-state
fetch ₀	$MA \leftarrow PC$	next
fetch ₁	$IR \leftarrow \text{Memory}$	spin
fetch ₂	$A \leftarrow PC$	next
fetch ₃	$PC \leftarrow A + 4$	dispatch
...		
ALU ₀	$A \leftarrow \text{Reg}[rs]$	next
ALU ₁	$B \leftarrow \text{Reg}[rt]$	next
ALU ₂	$\text{Reg}[rd] \leftarrow \text{func}(A, B)$	fetch
ALUi ₀	$A \leftarrow \text{Reg}[rs]$	next
ALUi ₁	$B \leftarrow \text{sExt}_{16}(\text{Imm})$	next
ALUi ₂	$\text{Reg}[rd] \leftarrow \text{Op}(A, B)$	fetch

Load & Store

State	Control points	next-state
LW₀	A ← Reg[rs]	next
LW₁	B ← sExt₁₆(Imm)	next
LW₂	MA ← A+B	next
LW₃	Reg[rt] ← Memory	spin
LW₄		fetch
SW₀	A ← Reg[rs]	next
SW₁	B ← sExt₁₆(Imm)	next
SW₂	MA ← A+B	next
SW₃	Memory ← Reg[rt]	spin
SW₄		fetch

Branches

State	Control points	next-state
BEQZ₀	A ← Reg[rs]	next
BEQZ₁		fnez
BEQZ₂	A ← PC	next
BEQZ₃	B ← sExt₁₆(Imm<<2)	next
BEQZ₄	PC ← A+B	fetch
BNEZ₀	A ← Reg[rs]	next
BNEZ₁		feqz
BNEZ₂	A ← PC	next
BNEZ₃	B ← sExt₁₆(Imm<<2)	next
BNEZ₄	PC ← A+B	fetch

Jumps

State	Control points	next-state
J_0	$A \leftarrow PC$	next
J_1	$B \leftarrow IR$	next
J_2	$PC \leftarrow \text{JumpTarg}(A,B)$	fetch
JR_0	$A \leftarrow \text{Reg}[rs]$	next
JR_1	$PC \leftarrow A$	fetch
JAL_0	$A \leftarrow PC$	next
JAL_1	$\text{Reg}[31] \leftarrow A$	next
JAL_2	$B \leftarrow IR$	next
JAL_3	$PC \leftarrow \text{JumpTarg}(A,B)$	fetch
$JALR_0$	$A \leftarrow PC$	next
$JALR_1$	$B \leftarrow \text{Reg}[rs]$	next
$JALR_2$	$\text{Reg}[31] \leftarrow A$	next
$JALR_3$	$PC \leftarrow B$	fetch

VAX 11-780 Microcode

```

Sequential ISA Bottleneck

*Sequential
source code*

```
a = foo(b);
for (i=0, i<
```

Superscalar compiler

*Find independent
operations*

*Schedule
operations*

*Sequential
machine code*

Superscalar processor

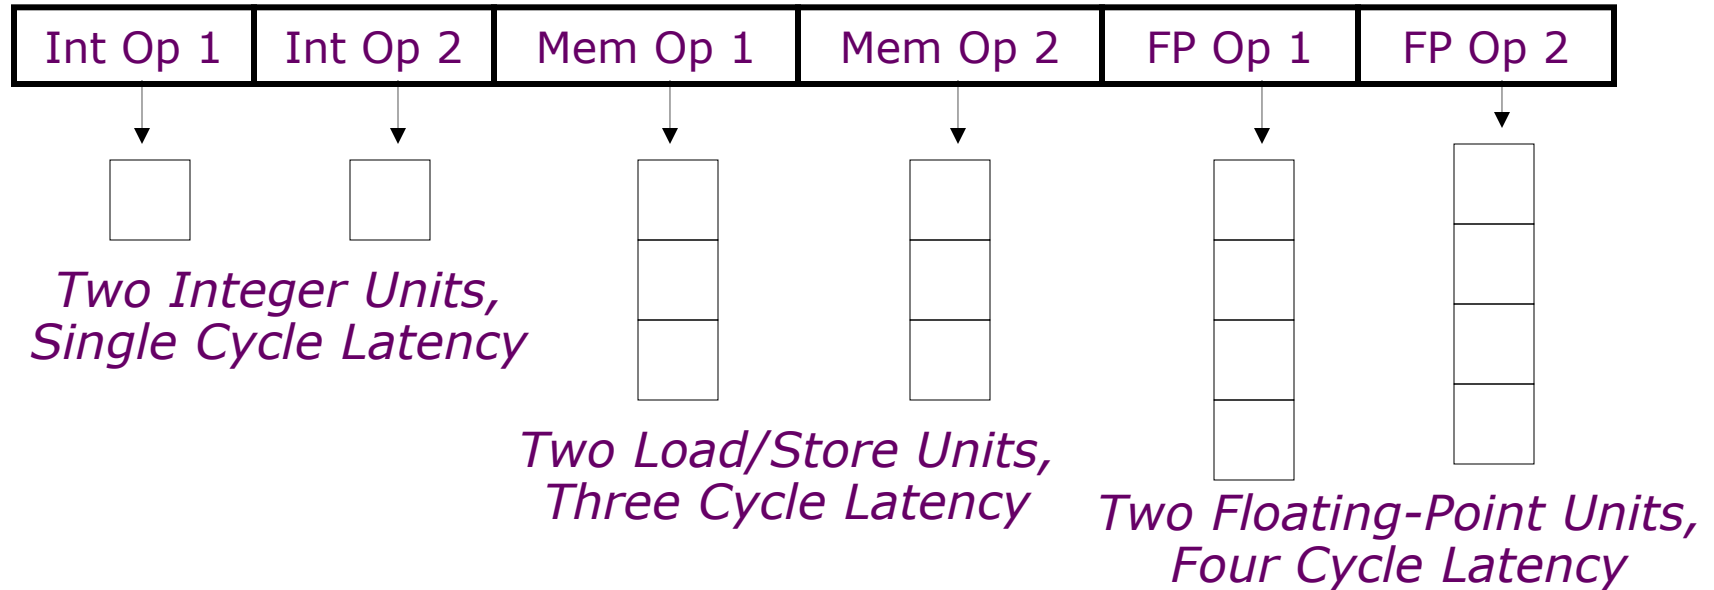

*Check instruction
dependencies*

*Schedule
execution*

VLIW: Very Long Instruction Word

- Multiple operations packed into one instruction
- Each operation slot is for a fixed function
- Constant operation latencies are specified

VLIW Design Principles

The architecture:

- Allows operation parallelism within an instruction
 - No x-operation RAW check
- Provides deterministic latency for all operations
 - Latency measured in 'instructions'
 - No data use allowed before specified latency with no data interlocks

The compiler:

- Schedules (reorders) to maximize parallel execution
- Guarantees intra-instruction parallelism
- Schedules to avoid data hazards (no interlocks)
 - Typically separates operations with explicit NOPs

Early VLIW Machines

- **FPS AP120B (1976)**
 - scientific attached array processor
 - first commercial wide instruction machine
 - hand-coded vector math libraries using software pipelining and loop unrolling
- **Multiflow Trace (1987)**
 - commercialization of ideas from Fisher's Yale group including "trace scheduling"
 - available in configurations with 7, 14, or 28 operations/instruction
 - 28 operations packed into a 1024-bit instruction word
- **Cydrome Cydra-5 (1987)**
 - 7 operations encoded in 256-bit instruction word
 - rotating register file

Loop Execution

```
for (i=0; i<N; i++)
  B[i] = A[i] + C;
```

Compile

```
loop: ld f1, 0(r1)
      add r1, 8
      fadd f2, f0, f1
      sd f2, 0(r2)
      add r2, 8
      bne r1, r3, loop
```

loop:

Schedule

	Int1	Int 2	M1	M2	FP+	FPx
add r1			ld			
					fadd	
add r2	bne		sd			

How many FP ops/cycle?

1 fadd / 8 cycles = 0.125

Loop Unrolling

```
for (i=0; i<N; i++)  
    B[i] = A[i] + C;
```

Unroll inner loop to
perform 4 iterations
at once

```
for (i=0; i<N; i+=4)  
{  
    B[i]    = A[i] + C;  
    B[i+1] = A[i+1] + C;  
    B[i+2] = A[i+2] + C;  
    B[i+3] = A[i+3] + C;  
}
```

Is this code correct?

No, need to handle values of N that are not multiples of unrolling factor with final cleanup loop

Scheduling Loop Unrolled Code

Unroll 4 ways

```

loop: ld f1, 0(r1)
      ld f2, 8(r1)
      ld f3, 16(r1)
      ld f4, 24(r1)
      add r1, 32
      fadd f5, f0, f1
      fadd f6, f0, f2
      fadd f7, f0, f3
      fadd f8, f0, f4
      sd f5, 0(r2)
      sd f6, 8(r2)
      sd f7, 16(r2)
      sd f8, 24(r2)
      add r2, 32
      bne r1, r3, loop
  
```

loop:

Schedule →

Int1	Int 2	M1	M2	FP+	FPx
		ld f1			
		ld f2			
		ld f3			
add r1		ld f4		fadd f5	
				fadd f6	
				fadd f7	
				fadd f8	
		sd f5			
		sd f6			
		sd f7			
add r2	bne	sd f8			

How many FLOPS/cycle?

4 fadds / 11 cycles = 0.36

Software Pipelining

Unroll 4 ways first

```

loop: ld f1, 0(r1)
      ld f2, 8(r1)
      ld f3, 16(r1)
      ld f4, 24(r1)
      add r1, 32
      fadd f5, f0, f1
      fadd f6, f0, f2
      fadd f7, f0, f3
      fadd f8, f0, f4
      sd f5, 0(r2)
      sd f6, 8(r2)
      sd f7, 16(r2)
      add r2, 32
      sd f8, -8(r2)
      bne r1, r3, loop
  
```

	Int1	Int 2	M1	M2	FP+	FPx
prolog			ld f1			
			ld f2			
			ld f3			
	add r1		ld f4			
			ld f1		fadd f5	
			ld f2		fadd f6	
			ld f3		fadd f7	
	add r1		ld f4		fadd f8	
iterate			ld f1	sd f5	fadd f5	
			ld f2	sd f6	fadd f6	
		add r2	ld f3	sd f7	fadd f7	
	add r1	bne	ld f4	sd f8	fadd f8	
epilog				sd f5	fadd f5	
				sd f6	fadd f6	
		add r2		sd f7	fadd f7	
		bne		sd f8	fadd f8	
				sd f5		

How many FLOPS/cycle?

$$4 \text{ fadds} / 4 \text{ cycles} = 1$$

Software Pipelining vs. Loop Unrolling

Loop Unrolled

Software Pipelined

Software pipelining pays startup/wind-down costs only once per loop, not once per iteration

What if there are no loops?

- Branches limit basic block size in control-flow intensive irregular code
- Difficult to find ILP in individual basic blocks

Trace Scheduling [Fisher, Ellis]

- Pick string of basic blocks, a *trace*, that represents most frequent branch path
- Schedule whole "trace" at once
- Add fixup code to cope with branches jumping out of trace

How do we know which trace to pick?

Use profiling feedback or compiler heuristics to find common branch paths

Problems with “Classic” VLIW

- Knowing branch probabilities
 - Profiling requires a significant extra step in build process
- Scheduling for statically unpredictable branches
 - optimal schedule varies with branch path
- Object code size
 - instruction padding wastes instruction memory/cache
 - loop unrolling/software pipelining replicates code
- Scheduling memory operations
 - caches and/or memory bank conflicts impose statically unpredictable variability
 - uncertainty about addresses limit code reordering
- Object-code compatibility
 - have to recompile all code for every machine, even for two machines in same generation

VLIW Instruction Encoding

- Schemes to reduce effect of unused fields
 - Compressed format in memory, expand on I-cache refill
 - used in Multiflow Trace
 - introduces instruction addressing challenge
 - Provide a single-op VLIW instruction
 - Cydra-5 UniOp instructions
 - Mark parallel groups
 - used in TMS320C6x DSPs, Intel IA-64

Cydra-5: Memory Latency Register (MLR)

Problem: Loads have variable latency

Solution: Let software choose desired memory latency

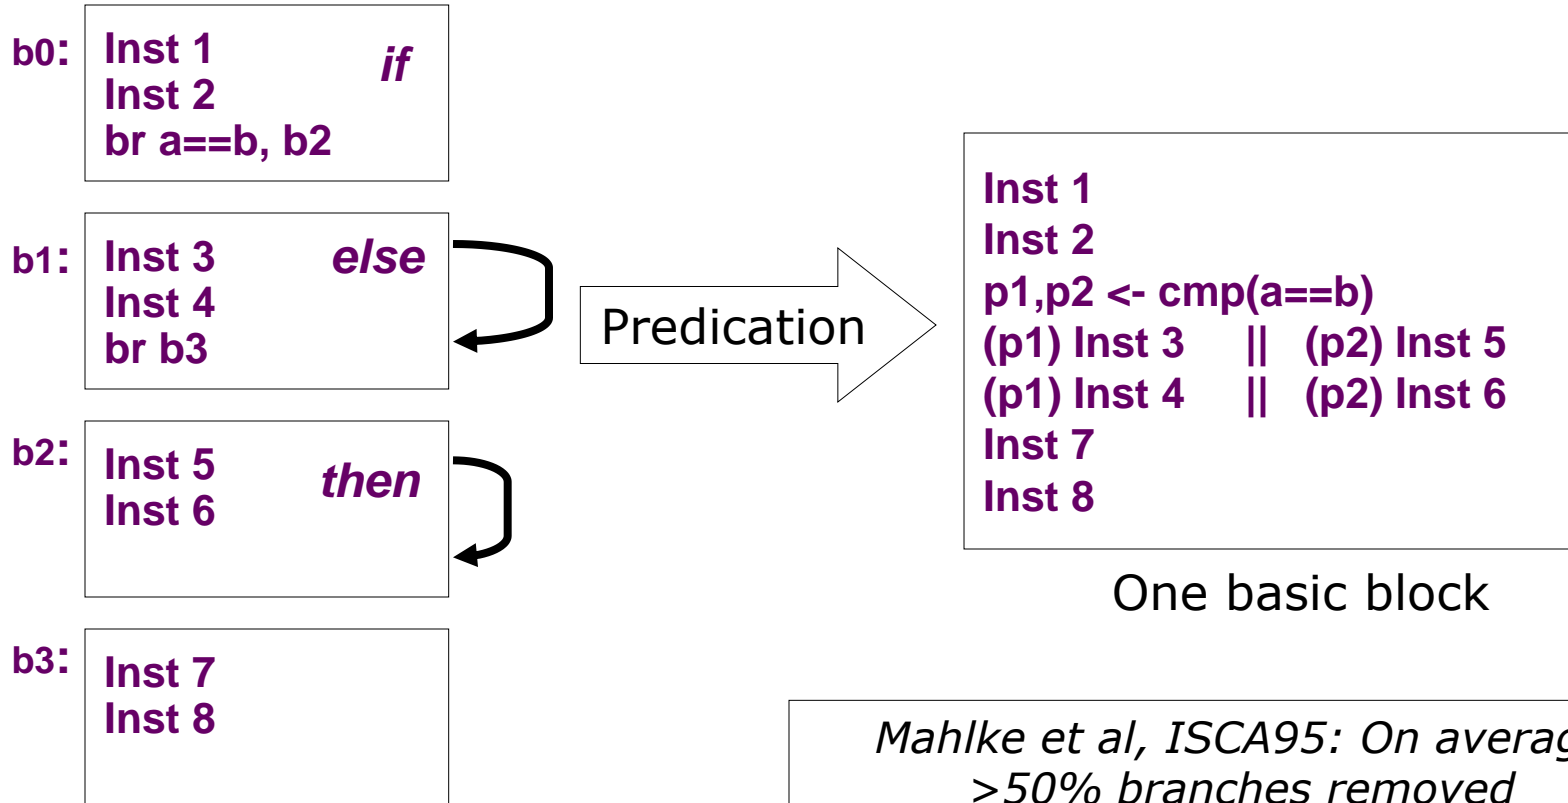

- Compiler schedules code for maximum load-use distance
- Software sets MLR to latency that matches code schedule
- Hardware ensures that loads take exactly MLR cycles to return values into processor pipeline
 - Hardware buffers loads that return early
 - Hardware stalls processor if loads return late

IA-64 Predicated Execution

Problem: Mispredicted branches limit ILP

Solution: Eliminate hard to predict branches with predicated execution

- Almost all IA-64 instructions can be executed conditionally under predicate
- Instruction becomes NOP if predicate register false

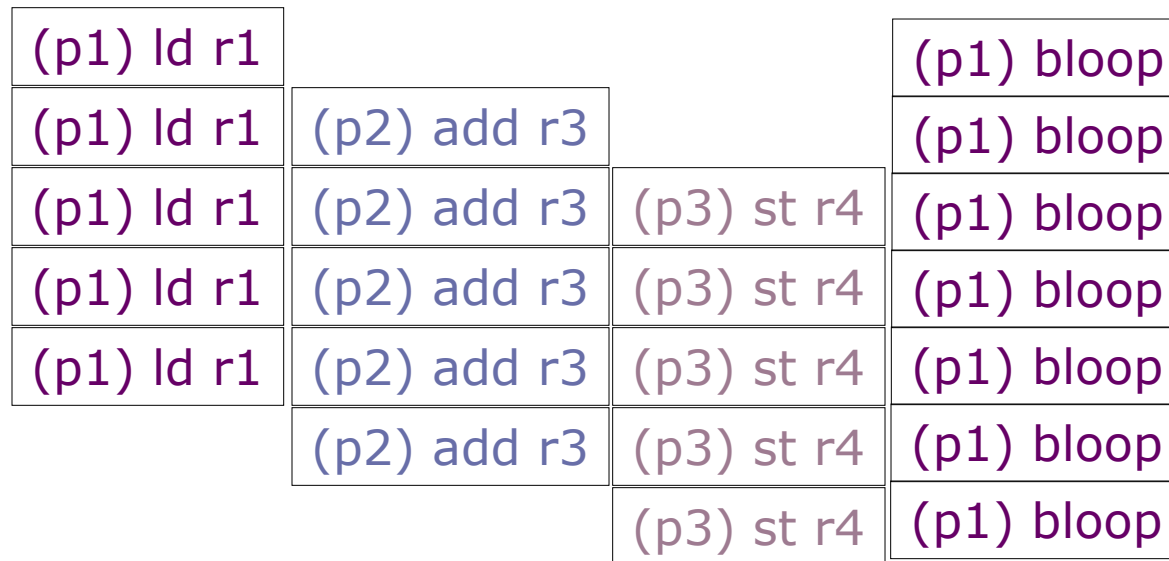

Predicate Software Pipeline Stages

Single VLIW Instruction

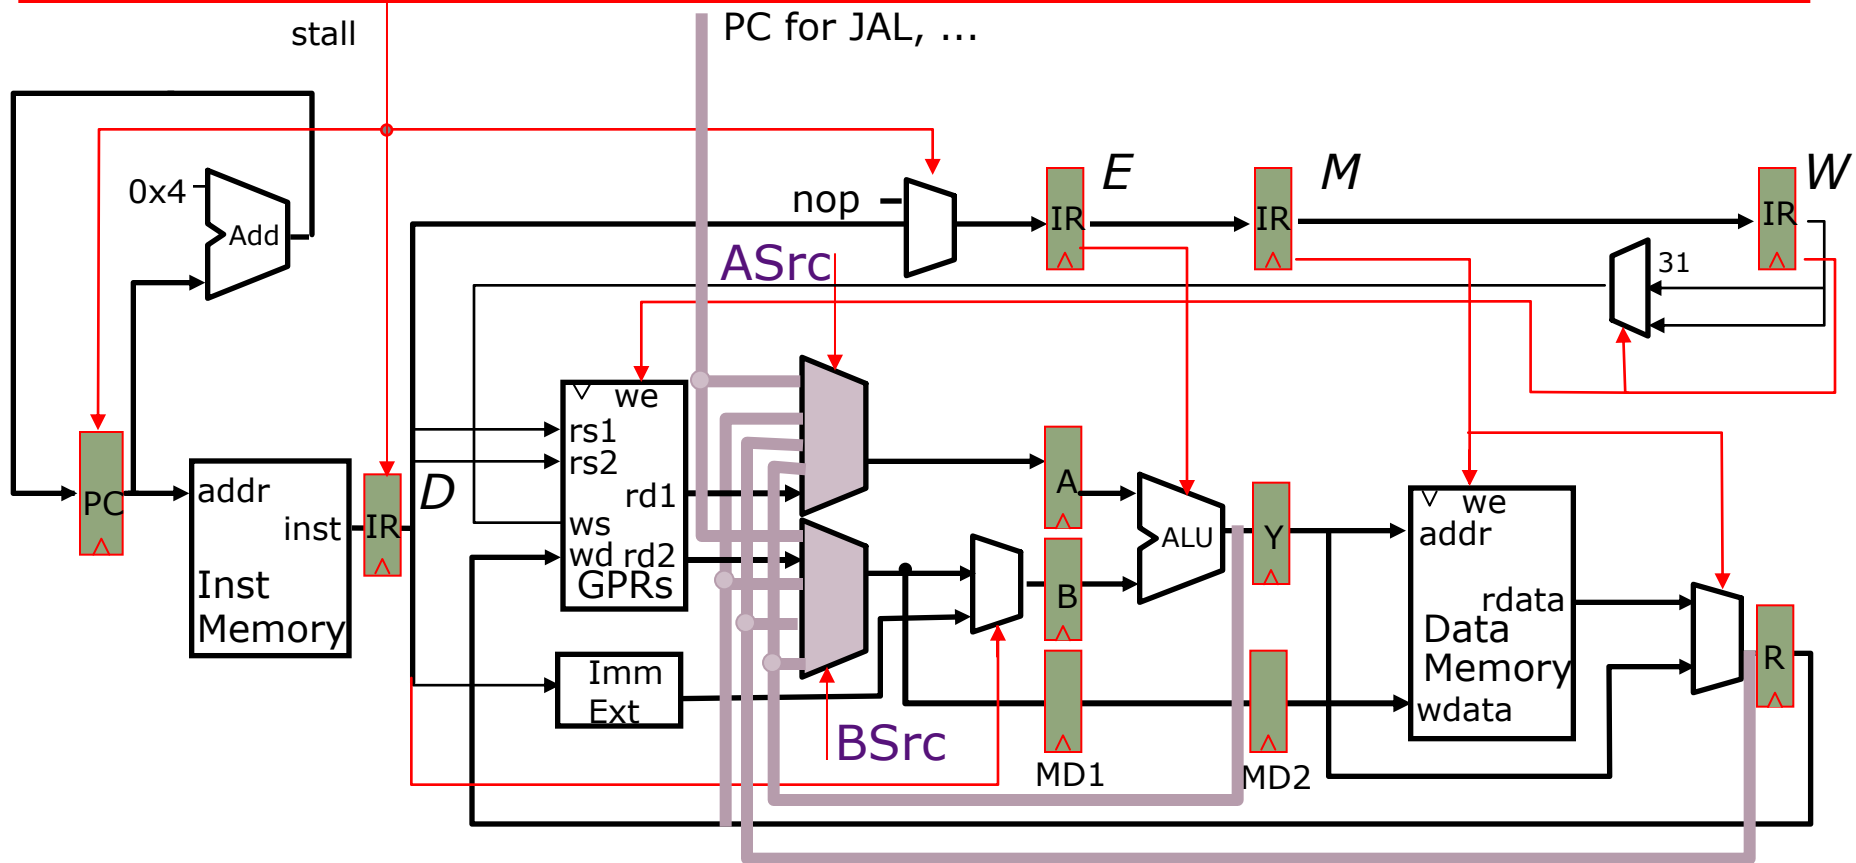

Dynamic Execution

Software pipeline stages turned on by rotating predicate registers → Much denser encoding of loops

Fully Bypassed Datapath

Where does predication fit in?

IA-64 Speculative Execution

Problem: Branches restrict compiler code motion

Solution: Speculative operations that don't cause exceptions

Inst 1
Inst 2
br a==b, b2

Load r1
Use r1
Inst 3

*Can't move load above branch
because might cause spurious
exception*

Load.s r1
Inst 1
Inst 2
br a==b, b2

Chk.s r1
Use r1
Inst 3

*Speculative load
never causes
exception, but sets
"poison" bit on
destination register*

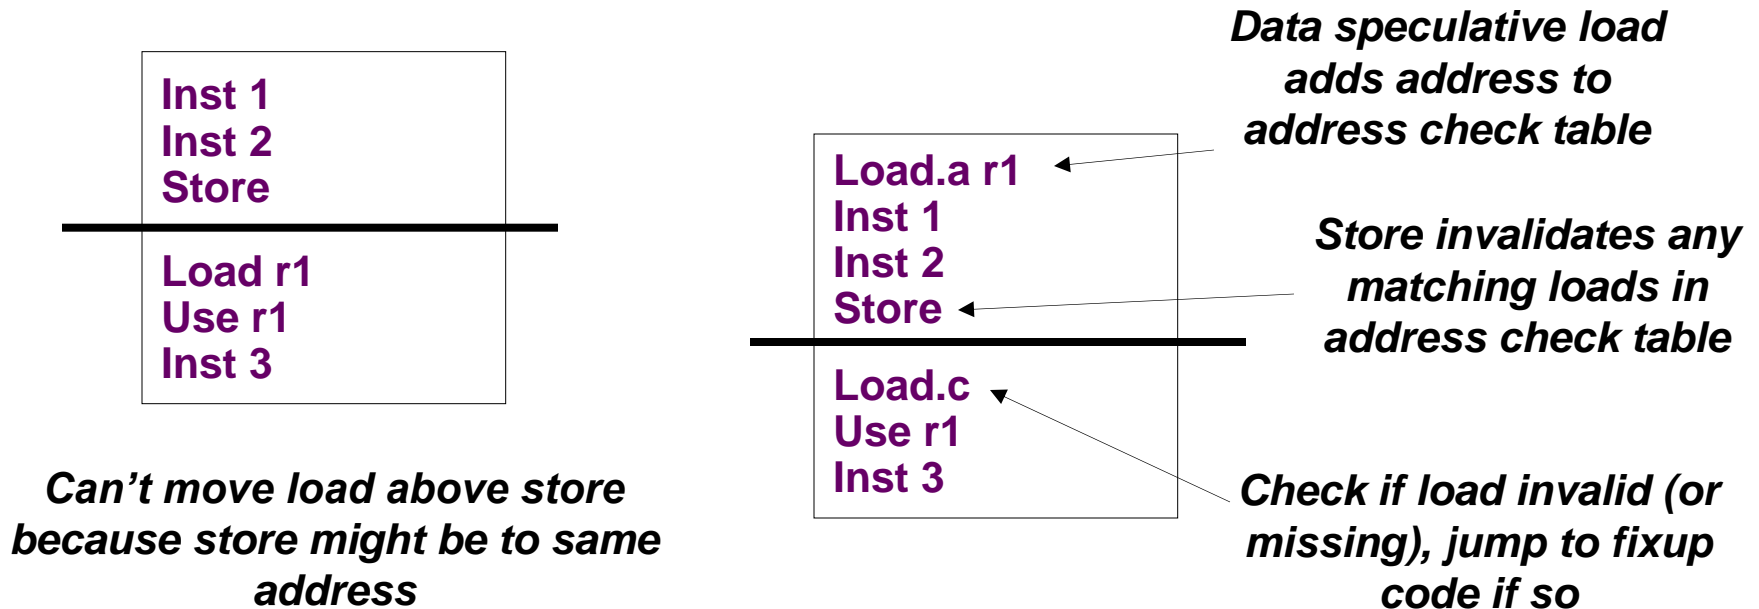

*Check for exception in
original home block
jumps to fixup code if
exception detected*

Particularly useful for scheduling long latency loads early

IA-64 Data Speculation

Problem: Possible memory hazards limit code scheduling

Solution: Instruction-based speculation with hardware monitor to check for pointer hazards

Requires associative hardware in address check table

Clustered VLIW

- Divide machine into clusters of local register files and local functional units
- Lower bandwidth/higher latency interconnect between clusters
- Software responsible for mapping computations to minimize communication overhead
- Common in commercial embedded processors, examples include TI C6x series DSPs, and HP Lx processor
- Exists in some superscalar processors, .e.g., Alpha 21264

Limits of Static Scheduling

- Unpredictable branches
- Unpredictable memory behavior (cache misses and dependencies)
- Code size explosion
- Compiler complexity

Question:

How applicable are the VLIW-inspired techniques to traditional RISC/CISC processor architectures?

Thank you !
