

Complex Pipelining

Mengjia Yan

Computer Science and Artificial Intelligence Laboratory
M.I.T.

Complex Pipelining: Motivation

Instruction pipelining becomes complex when we want high performance in the presence of

- Multi-cycle operations, for example:
 - Full or partially pipelined floating-point units, or
 - Long-latency operations, e.g., divides
- Variable-latency operations, for example:
 - Memory systems with variable access time
- Replicated function units, for example:
 - Multiple floating-point or memory units

CDC 6600

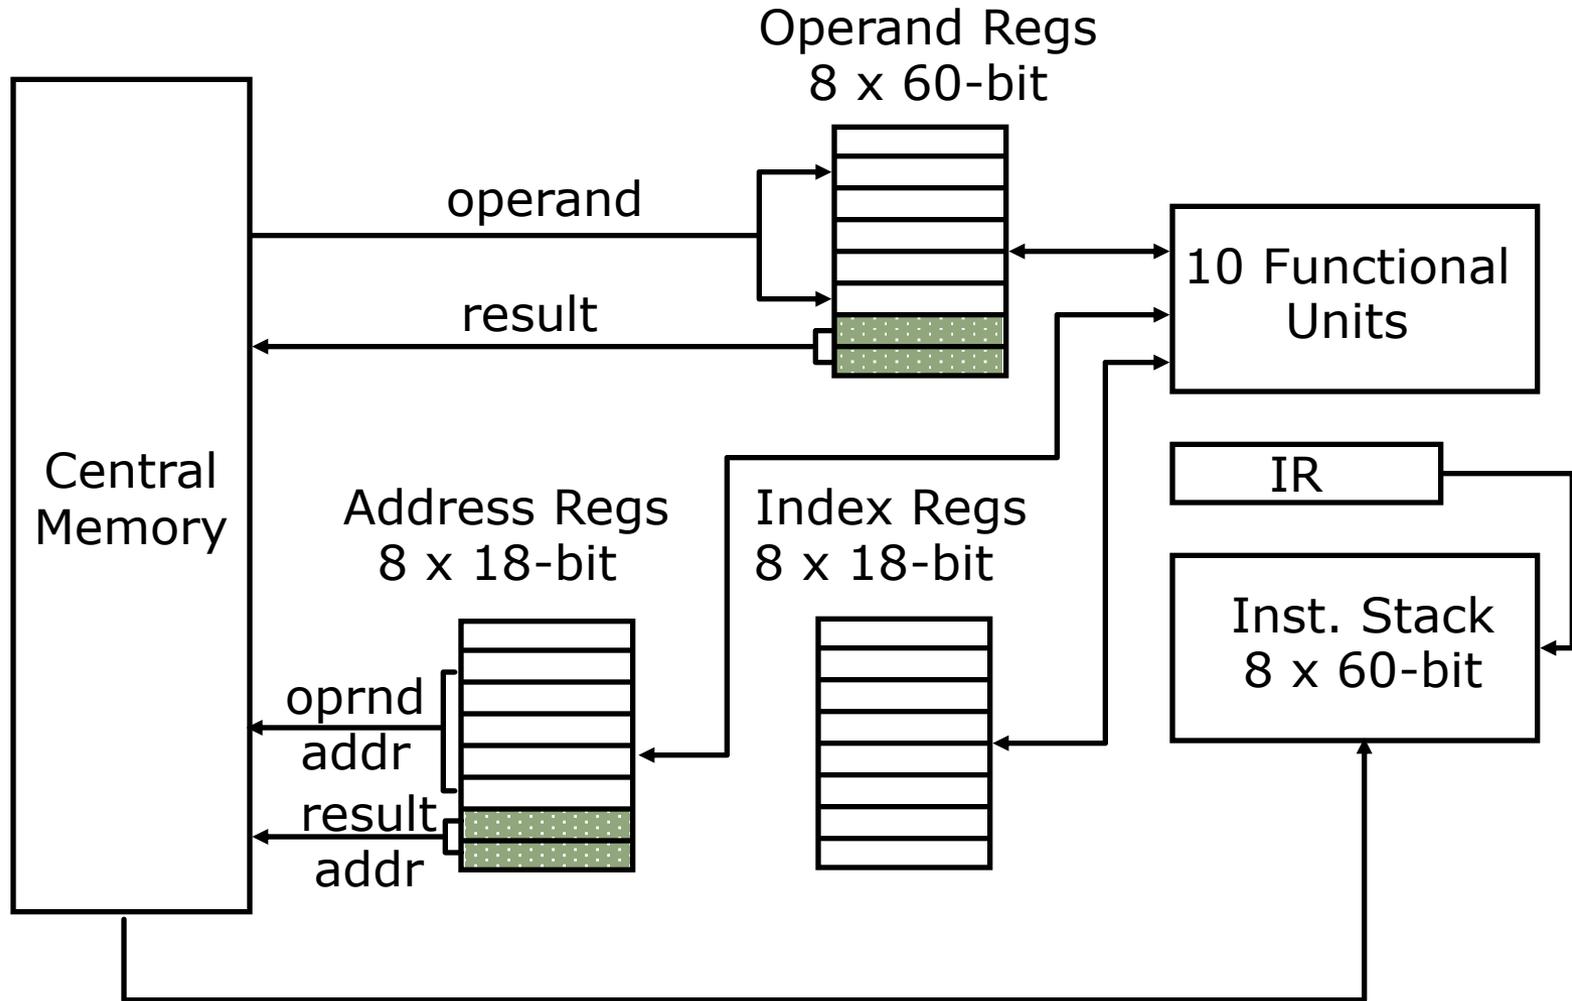

Seymour Cray, 1963

- A fast pipelined machine with 60-bit words
 - 128 Kword main memory capacity, 32 banks
- Ten functional units (parallel, unpipelined)
 - Floating Point: adder, 2 multipliers, divider
 - Integer: adder, 2 incrementers, ...
- Hardwired control
- **Dynamic scheduling of instructions using a scoreboard**
- Ten Peripheral Processors for Input/Output
 - A fast multi-threaded 12-bit integer ALU
- Very fast clock, 10 MHz (FP add in 4 clocks)
- >400,000 transistors, 750 sq. ft., 5 tons, 150 kW, new freon-based cooling technology
- Fastest machine in world for 5 years (until CDC 7600)
 - Over 100 sold (\$7-10M each)

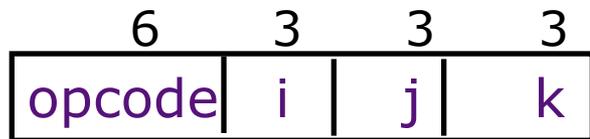

CDC 6600: Datapath

CDC 6600: A Load/Store Architecture

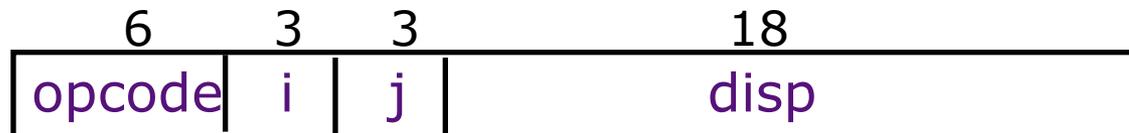

- Separate instructions to manipulate three types of reg.
 - 8 60-bit data registers (X)
 - 8 18-bit address registers (A)
 - 8 18-bit index registers (B)

- All arithmetic and logic instructions are reg-to-reg

$$R_i \leftarrow (R_j) \text{ op } (R_k)$$

- Only Load and Store instructions refer to memory!

$$R_i \leftarrow M[(R_j) + \text{disp}]$$

- Touching address registers 1 to 5 initiates a load
 - 6 to 7 initiates a store
 - *very useful for vector operations*

CDC6600: Vector Addition

```
      B1 ← - n
loop: JZE  B1, exit
      A1 ← B1 + a1      load into X1
      A2 ← B1 + b1      load into X2
      X6 ← X1 + X2
      A6 ← B1 + c1      store X6
      B1 ← B1 + 1
      jump loop
```

A_i = address register

B_i = index register

X_i = data register

more on vector processing later...

We will present complex pipelining issues more abstractly ...

Floating Point ISA

Interaction between the Floating point datapath and the Integer datapath is determined largely by the ISA

MIPS ISA

- separate register files for FP and Integer instructions
the only interaction is via a set of move instructions (some ISAs don't even permit this)
- separate load/store for FPR's and GPR's but both use GPR's for address calculation
- separate conditions for branches
FP branches are defined in terms of condition codes

Floating Point Unit

Much more hardware than an integer unit

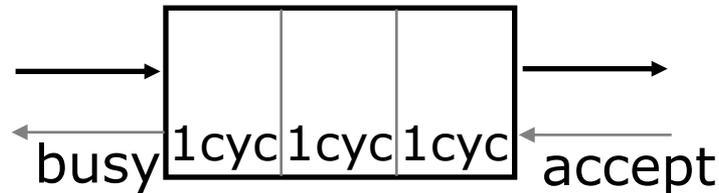

Single-cycle floating point unit is a bad idea - *why?*

- it is common to have several floating point units
- it is common to have different types of FPUs
Fadd, Fmul, Fdiv, ...
- an FPU may be pipelined, partially pipelined or not pipelined

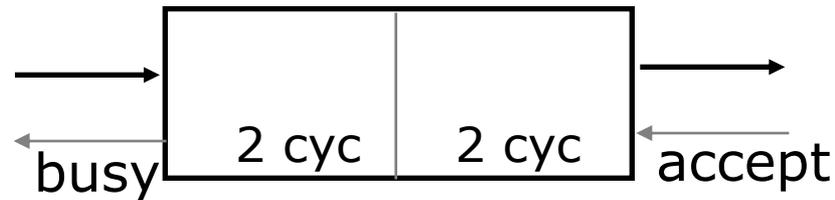

To operate several FPUs concurrently the register file needs to have more read and write ports

Functional Unit Characteristics

*fully
pipelined*

*partially
pipelined*

Functional units have internal pipeline registers

- ⇒ operands are latched when an instruction enters a functional unit
- ⇒ inputs to a functional unit (e.g., register file) can change during a long latency operation

Realistic Memory Systems

Latency of access to the main memory is usually much higher than one cycle and often unpredictable

Solving this problem is a central issue in computer architecture

Realistic Memory Systems

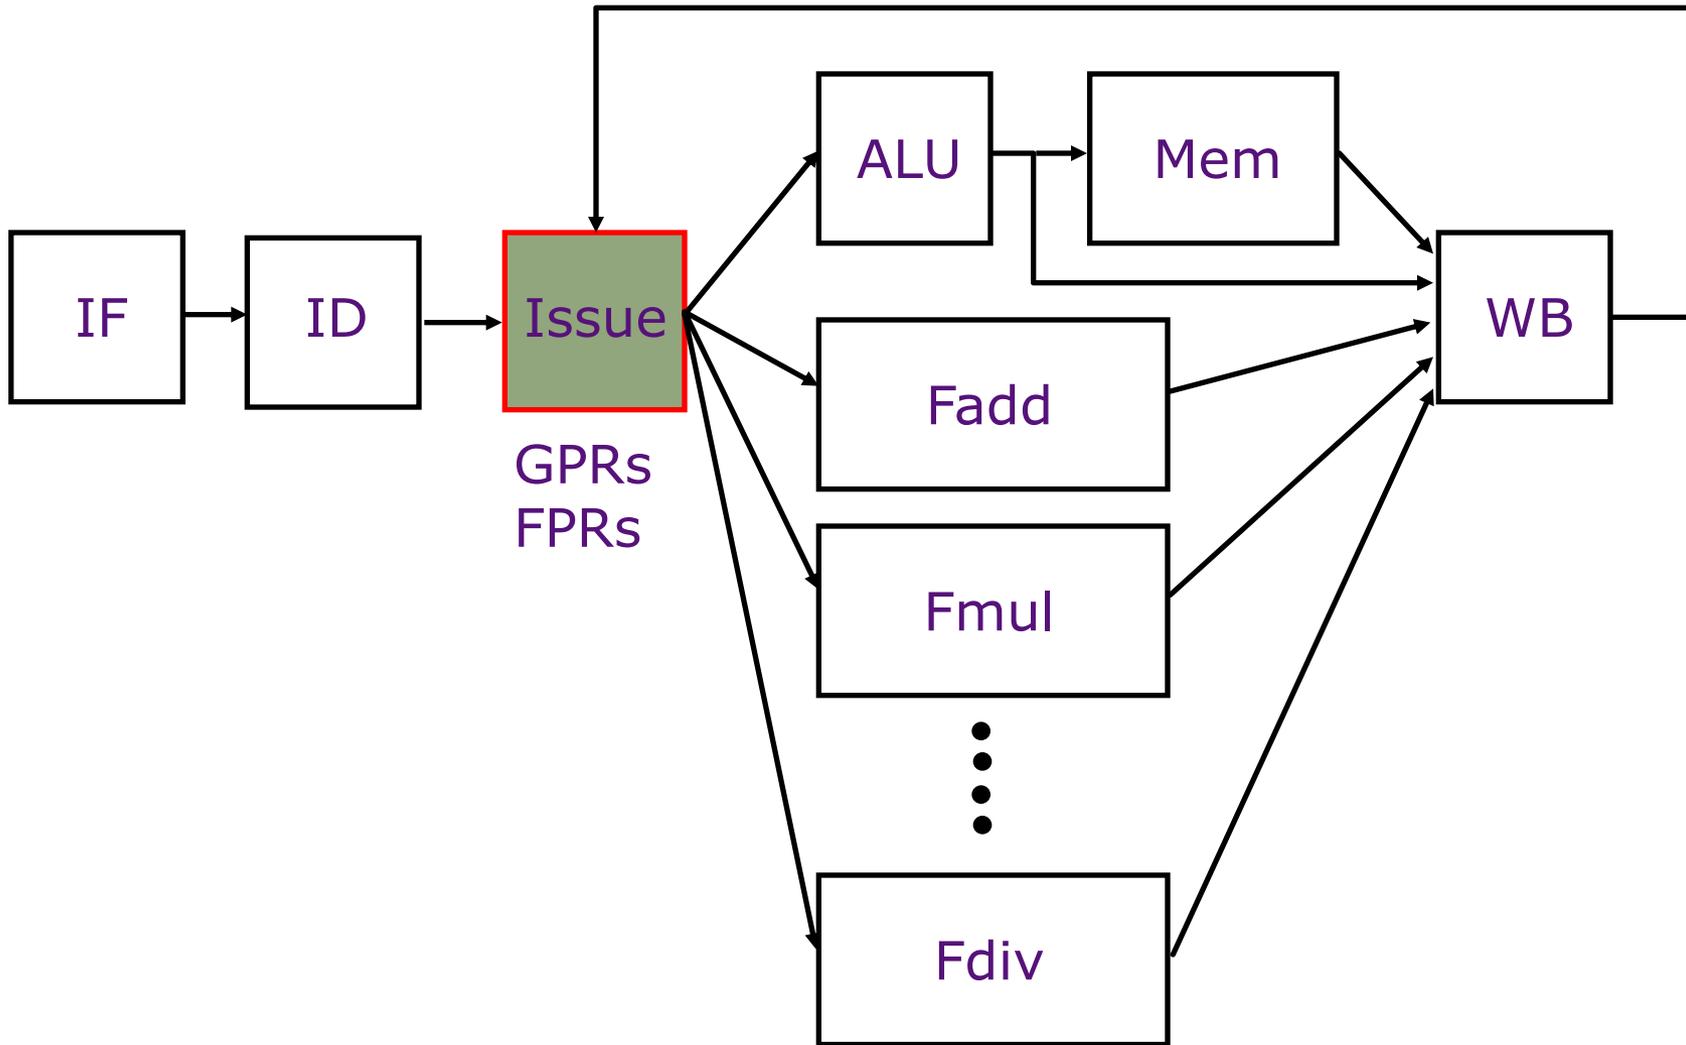

Latency of access to the main memory is usually much higher than one cycle and often unpredictable

Solving this problem is a central issue in computer architecture

Common approaches to improving memory performance

- separate instruction and data memory ports
 - ⇒ *no self-modifying code*
- caches
 - single cycle except in case of a miss ⇒ stall*
- interleaved memory
 - multiple memory accesses ⇒ bank conflicts*
- split-phase memory operations
 - ⇒ *out-of-order responses*

Complex Pipeline Structure

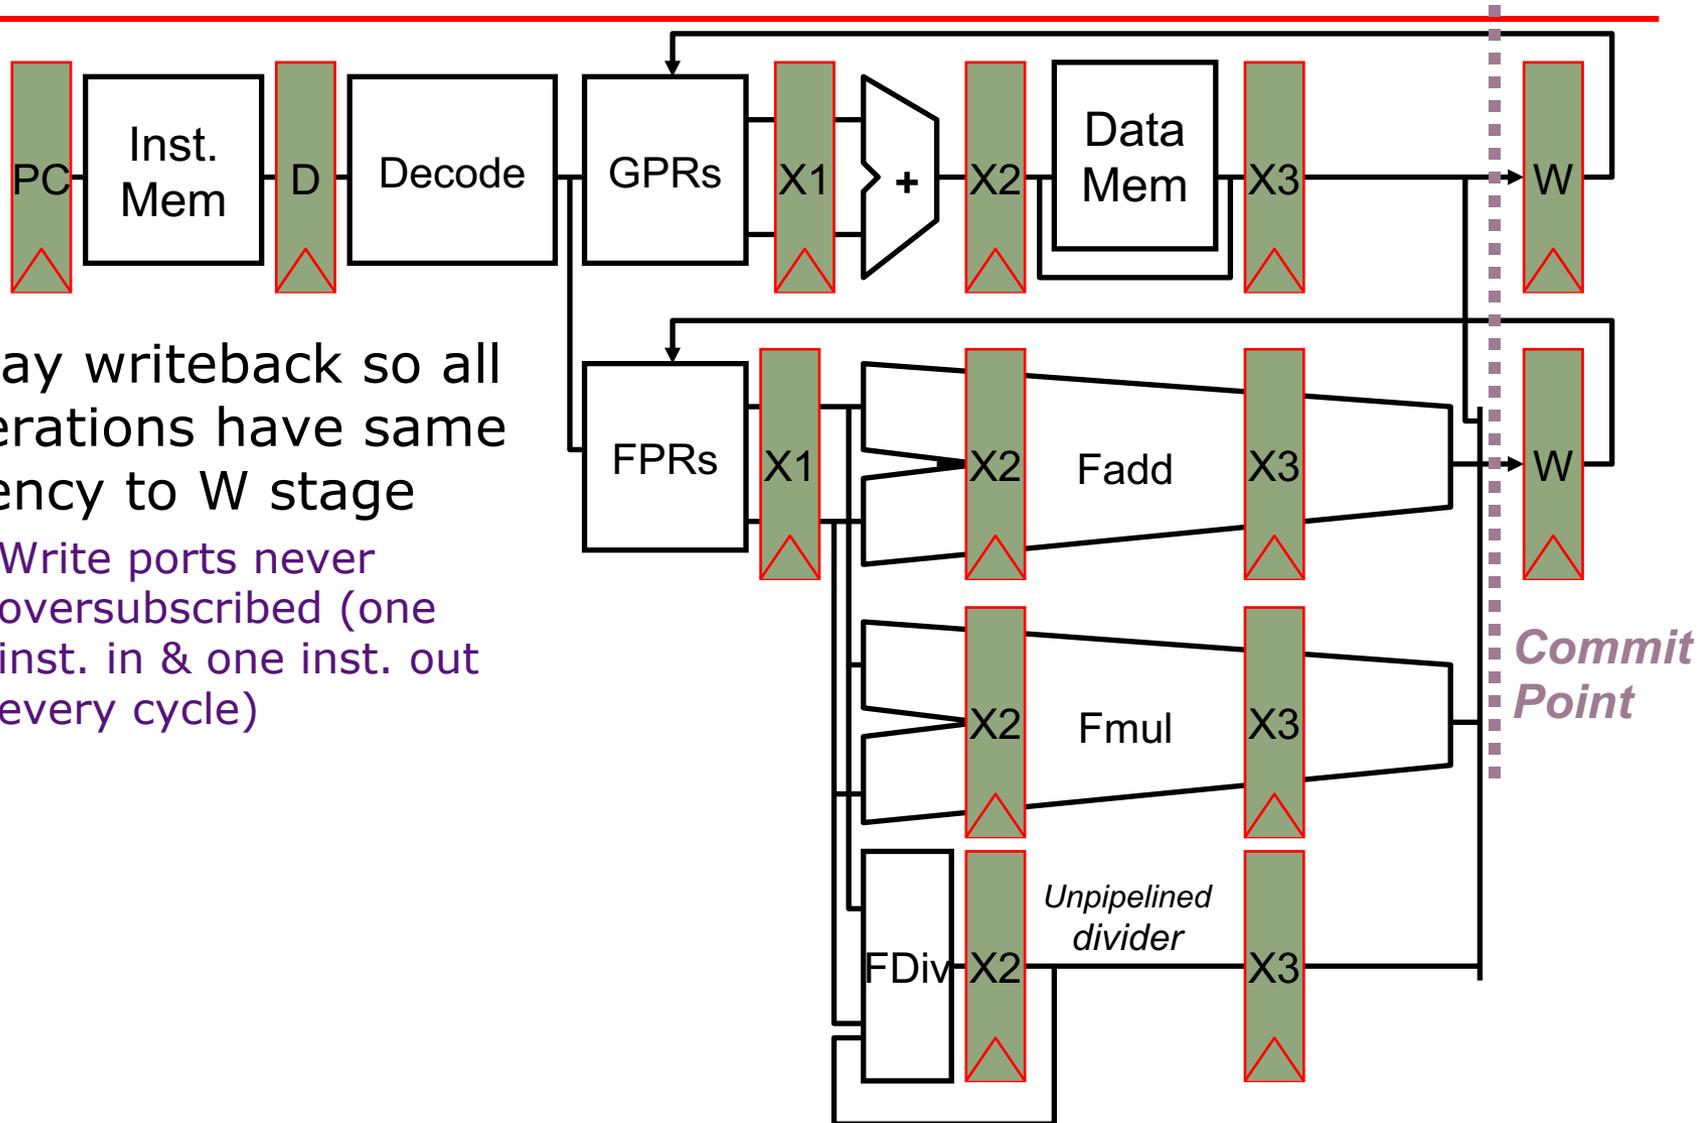

Complex Pipeline Control Issues

- Structural hazards at the execution stage if some FPU or memory unit is not pipelined and takes more than one cycle
- Structural hazards at the write-back stage due to variable latencies of different function units
- Out-of-order write hazards due to variable latencies of different function units

Complex Pipeline Control Issues

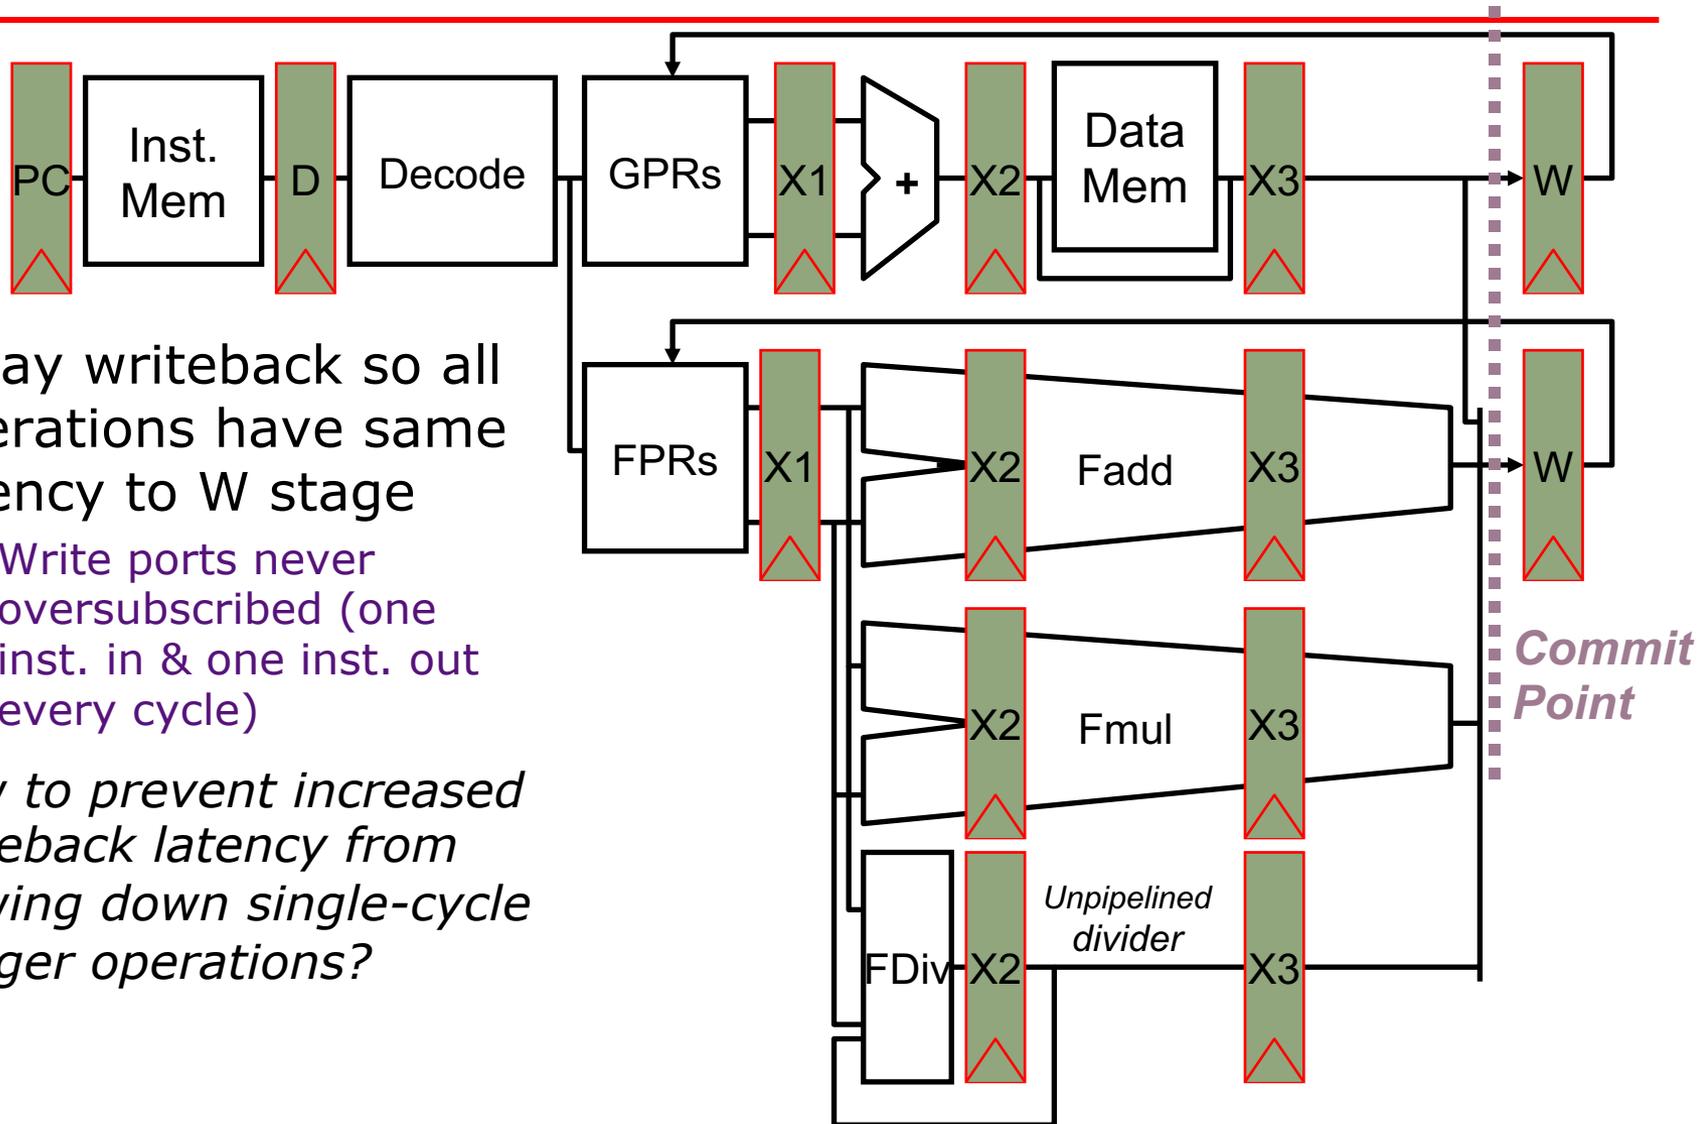

- Structural hazards at the execution stage if some FPU or memory unit is not pipelined and takes more than one cycle
- Structural hazards at the write-back stage due to variable latencies of different function units
- Out-of-order write hazards due to variable latencies of different function units
- How to handle exceptions?

Complex In-Order Pipeline

- Delay writeback so all operations have same latency to W stage
 - Write ports never oversubscribed (one inst. in & one inst. out every cycle)

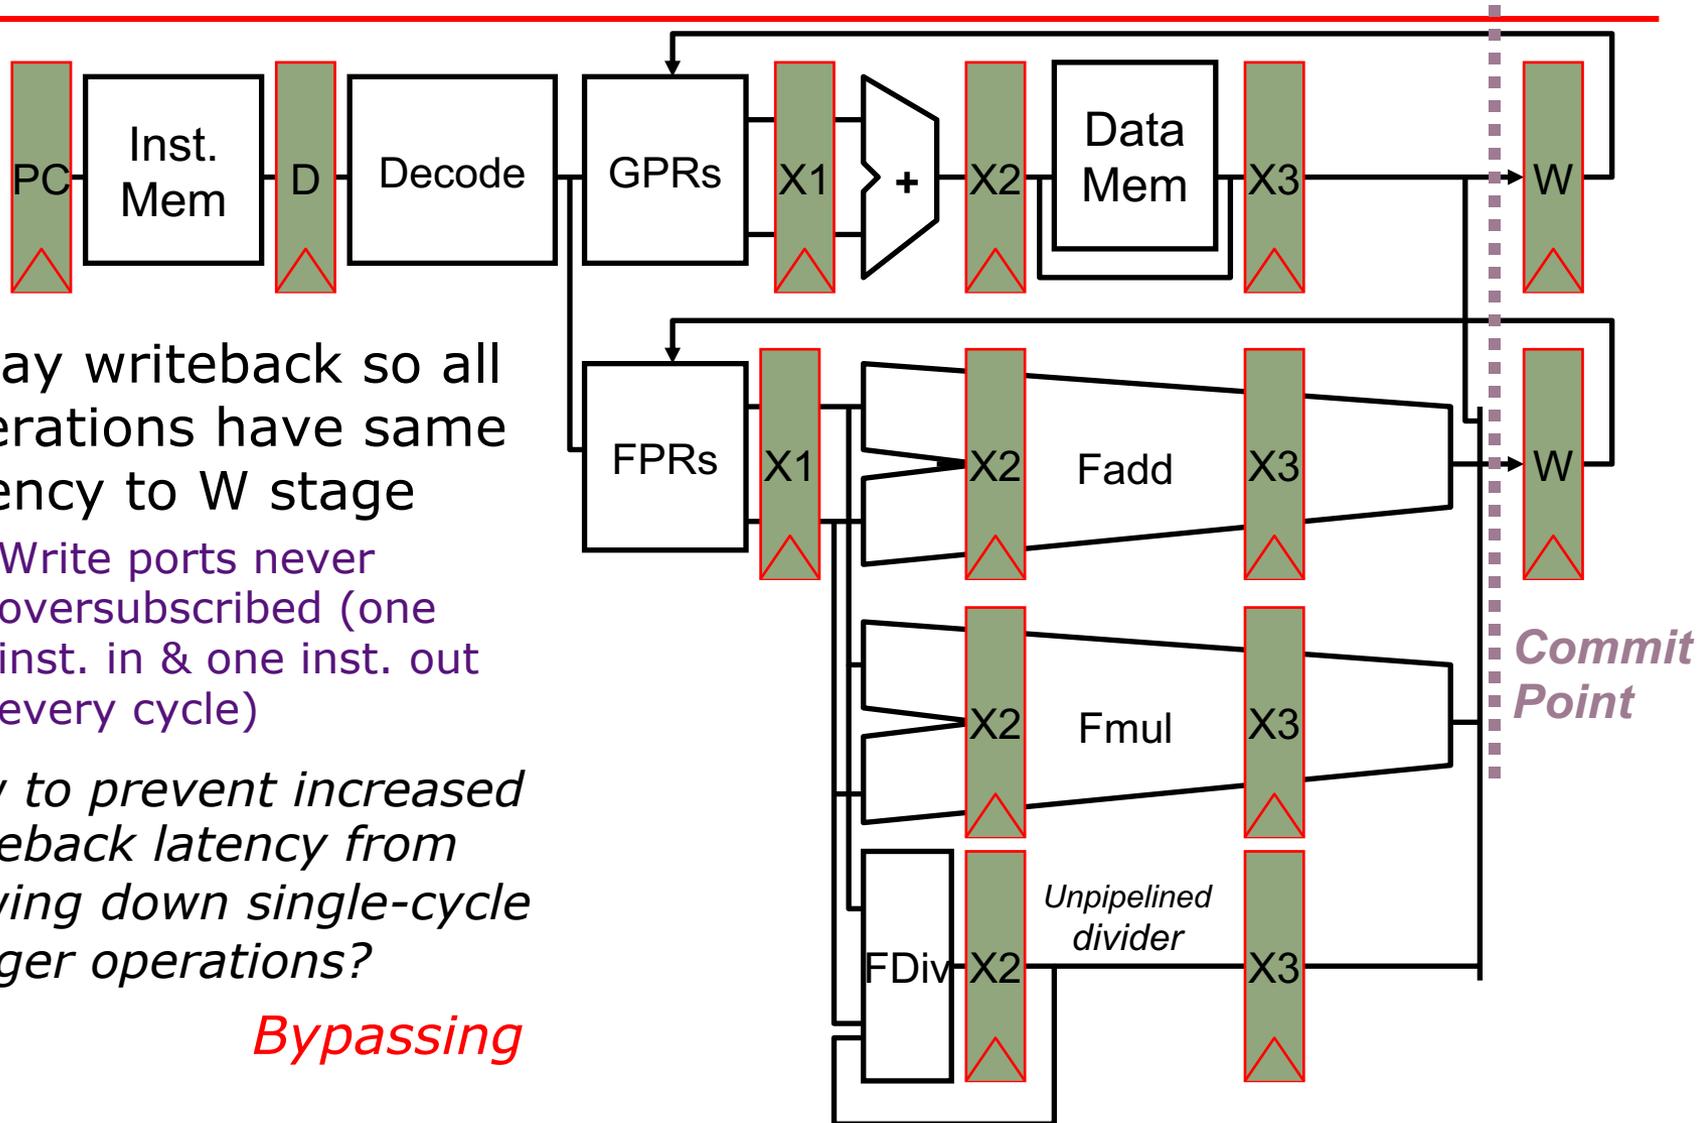

Complex In-Order Pipeline

- Delay writeback so all operations have same latency to W stage
 - Write ports never oversubscribed (one inst. in & one inst. out every cycle)

How to prevent increased writeback latency from slowing down single-cycle integer operations?

Complex In-Order Pipeline

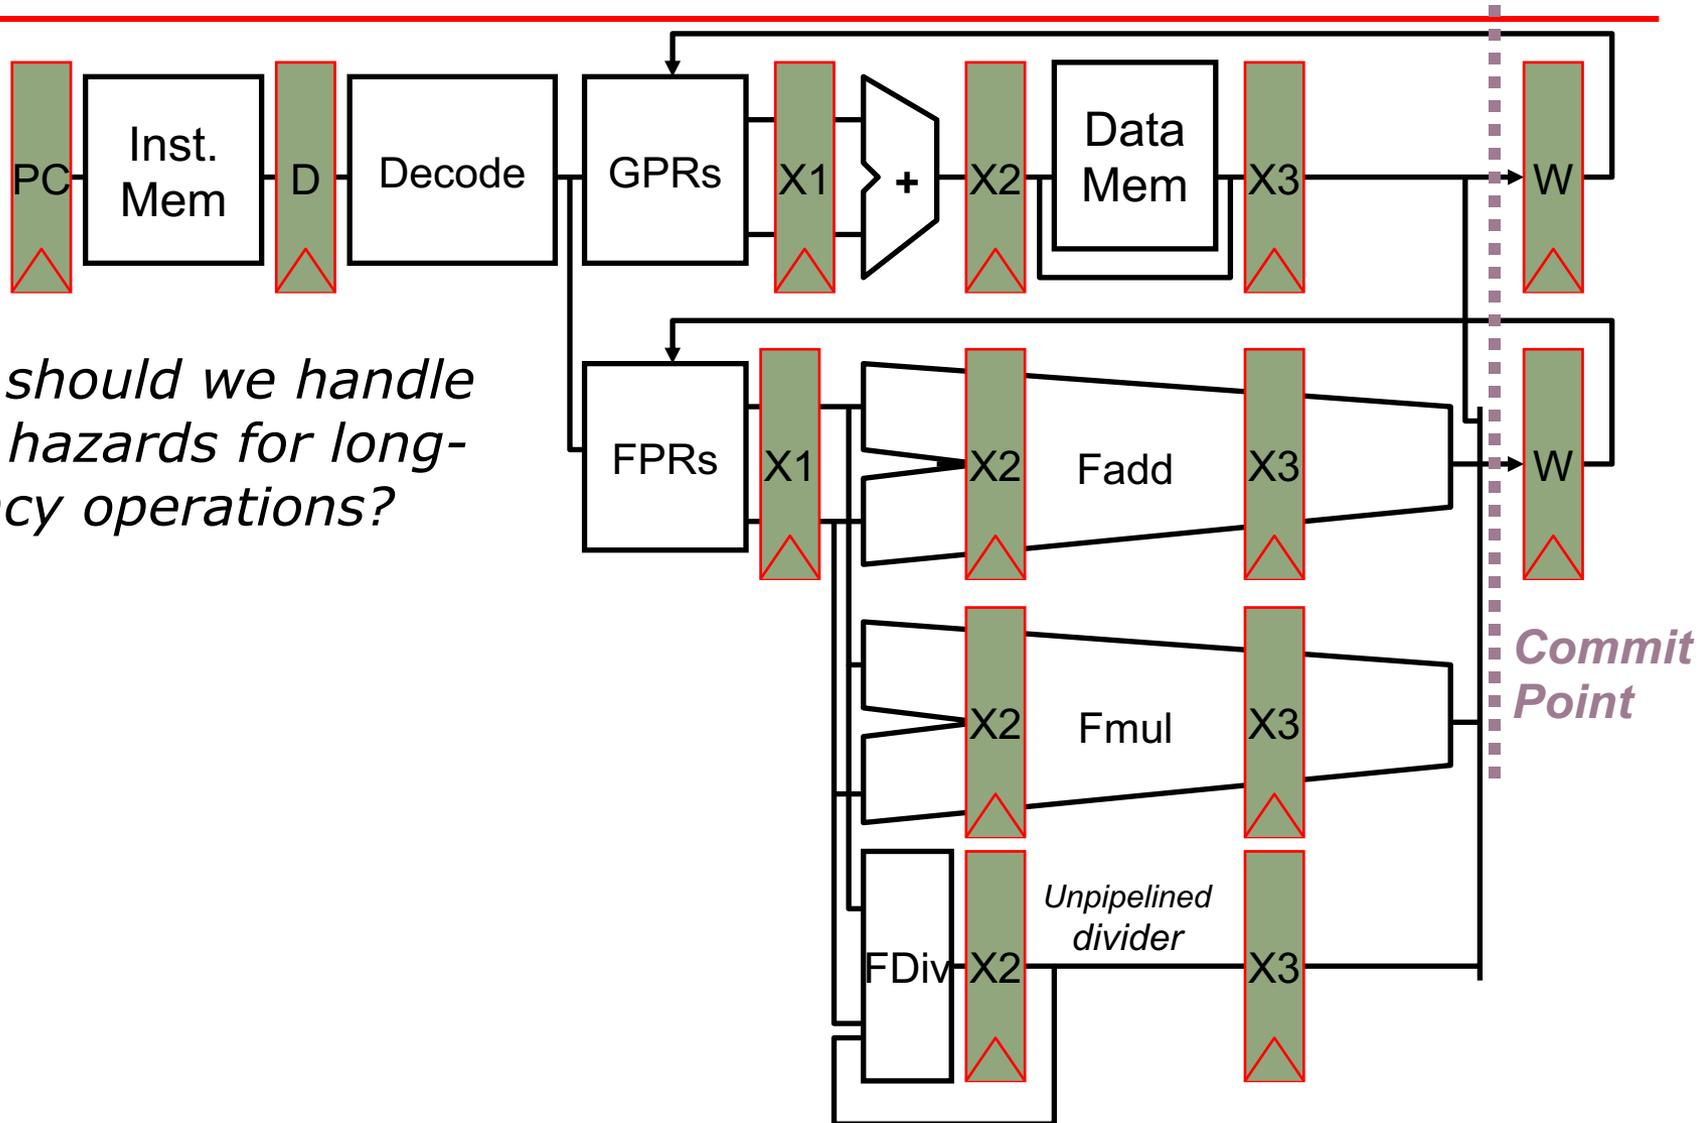

- Delay writeback so all operations have same latency to W stage
 - Write ports never oversubscribed (one inst. in & one inst. out every cycle)

How to prevent increased writeback latency from slowing down single-cycle integer operations?

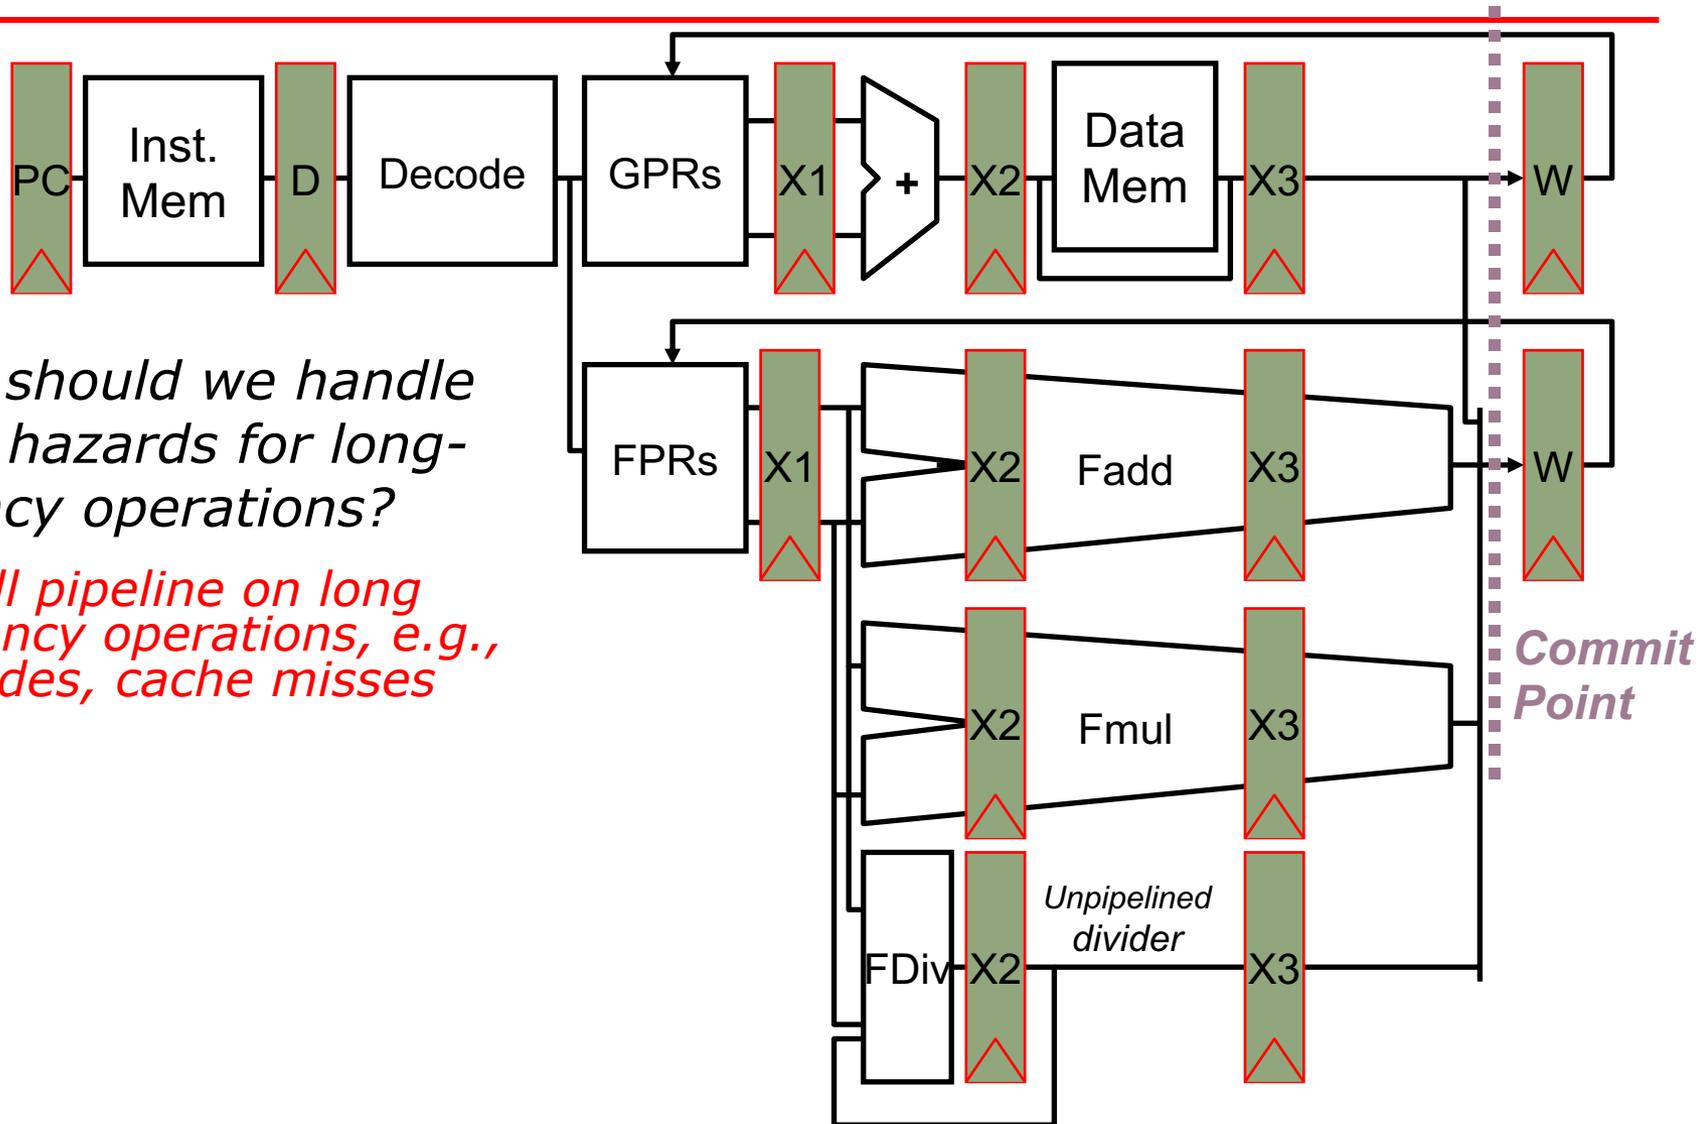

Bypassing

Complex In-Order Pipeline

How should we handle data hazards for long-latency operations?

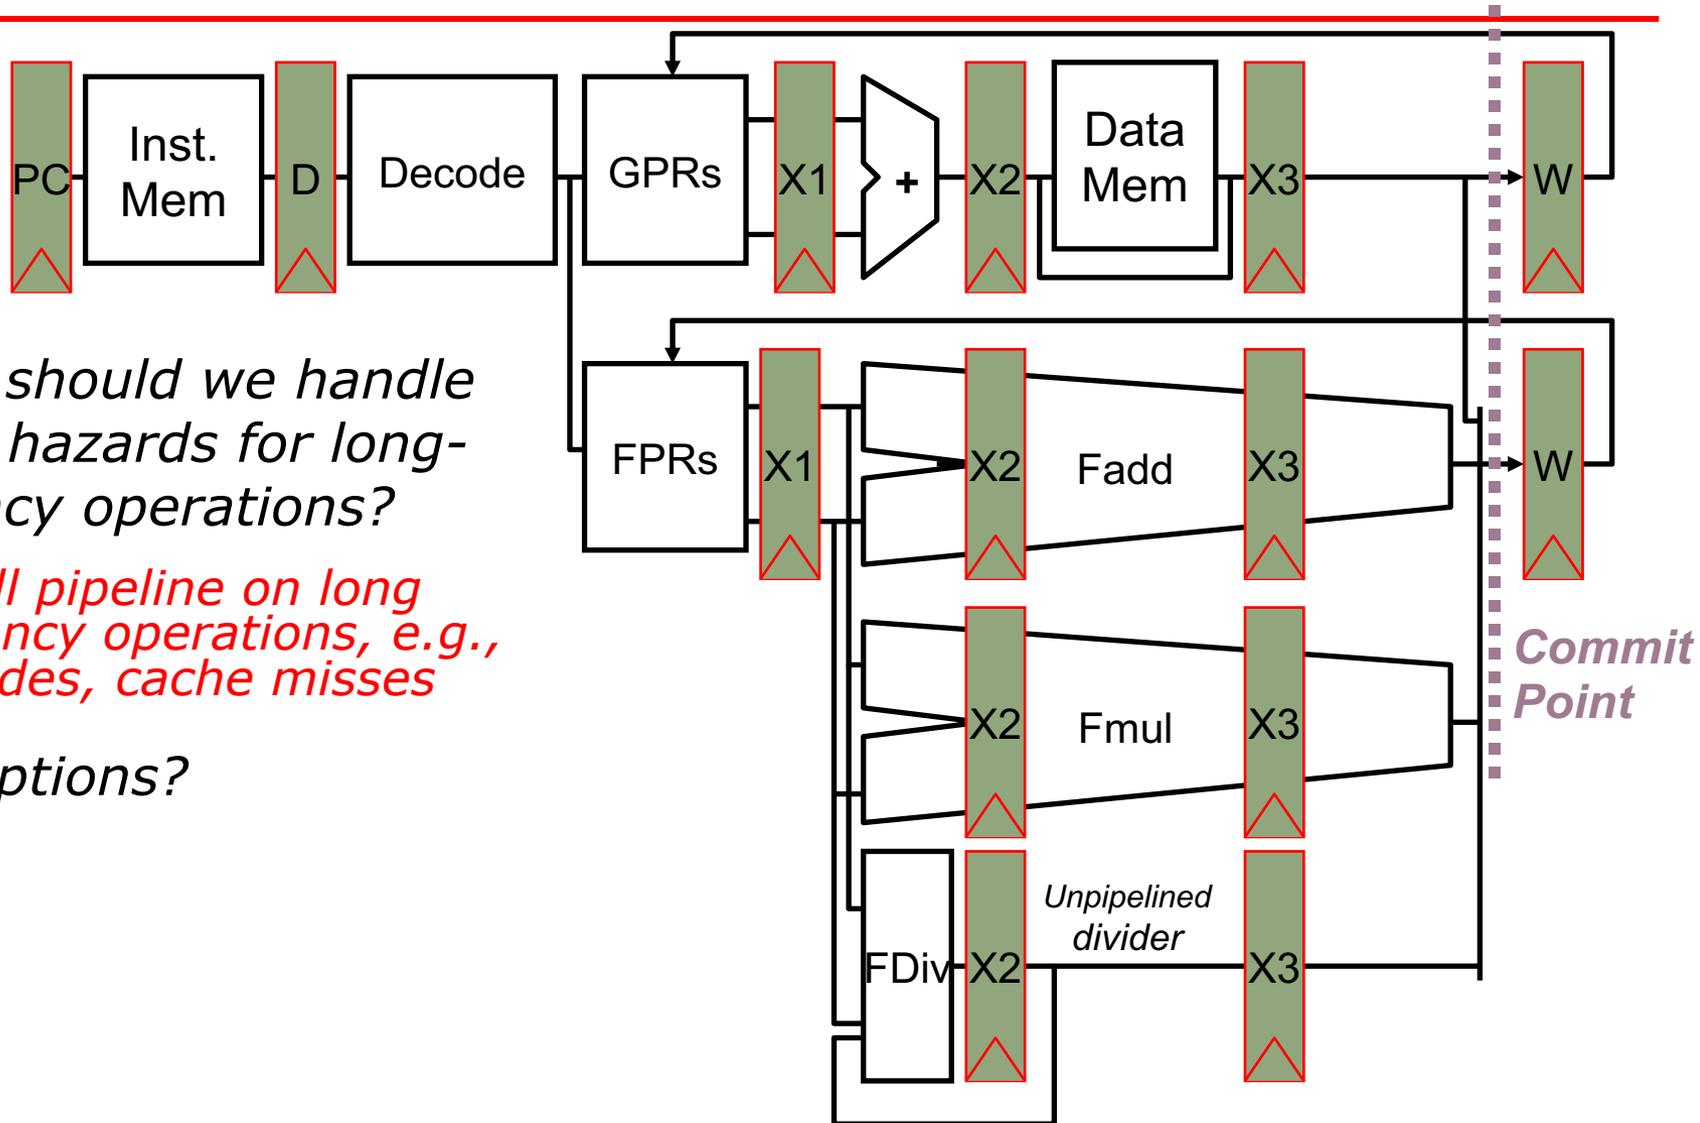

Complex In-Order Pipeline

How should we handle data hazards for long-latency operations?

Stall pipeline on long latency operations, e.g., divides, cache misses

Complex In-Order Pipeline

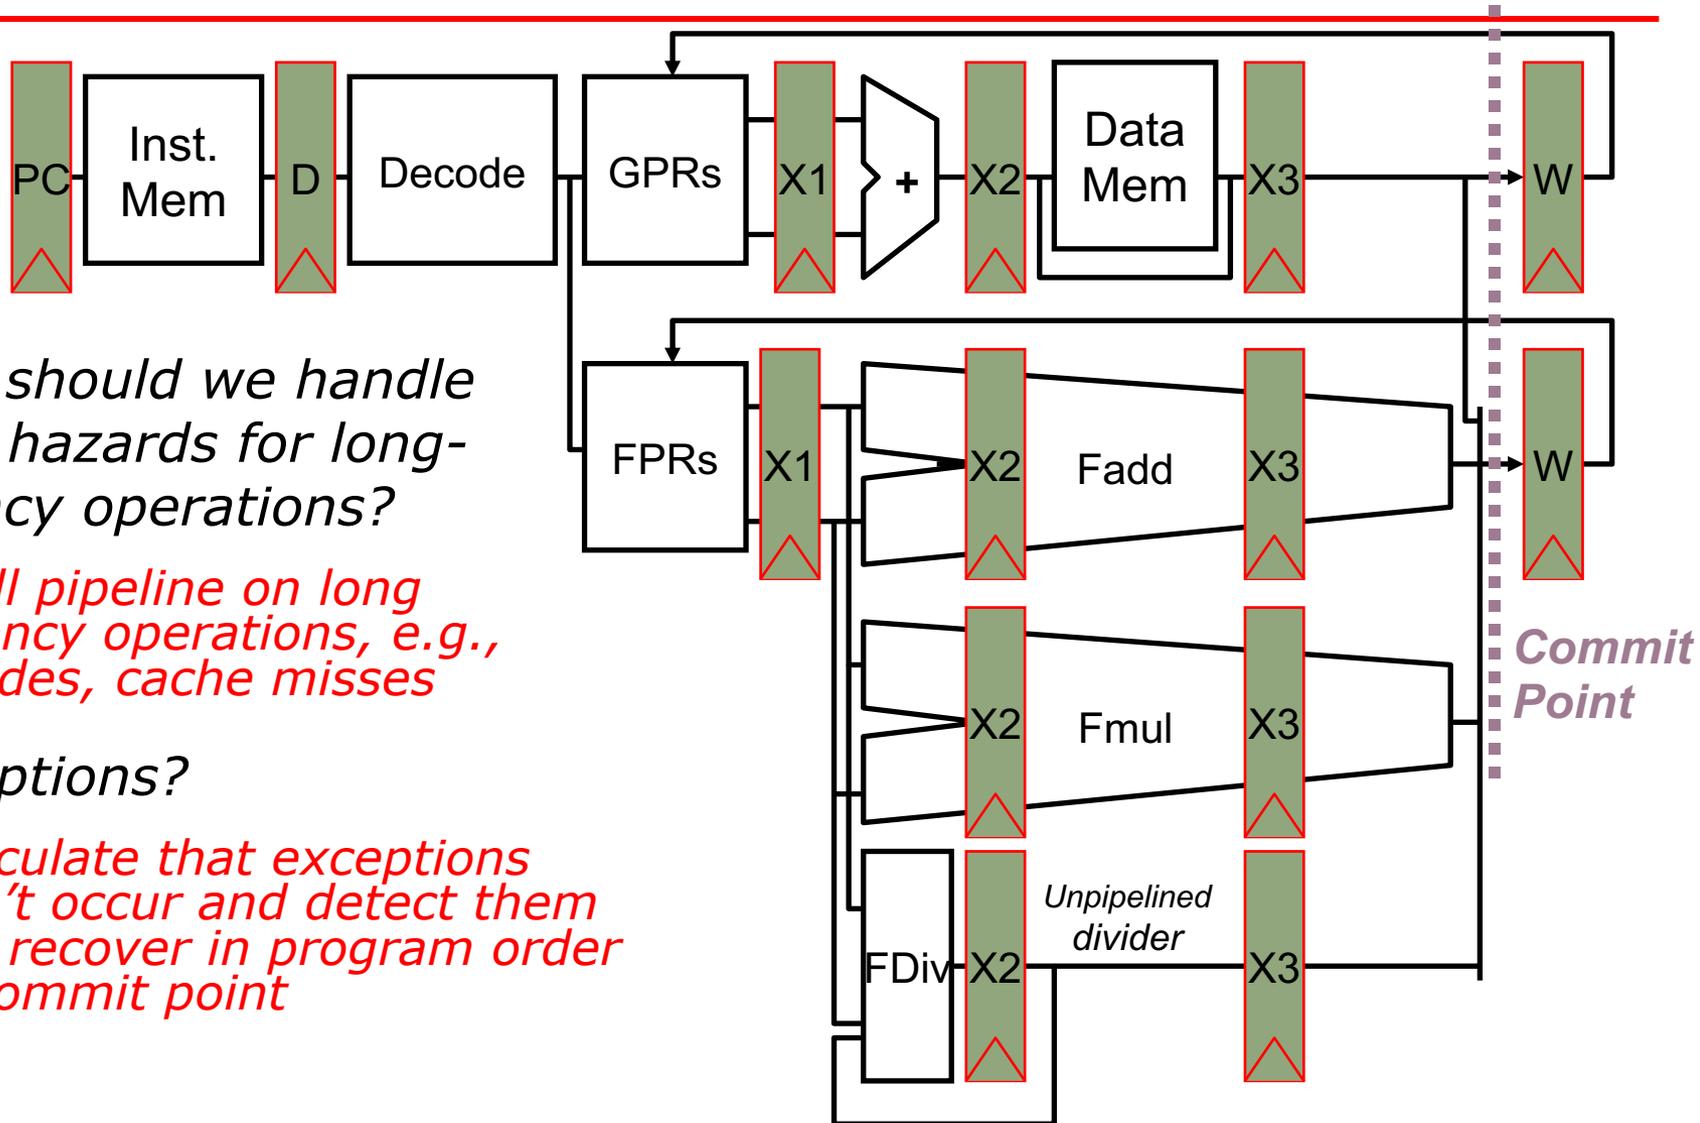

How should we handle data hazards for long-latency operations?

Stall pipeline on long latency operations, e.g., divides, cache misses

Exceptions?

Complex In-Order Pipeline

How should we handle data hazards for long-latency operations?

Stall pipeline on long latency operations, e.g., divides, cache misses

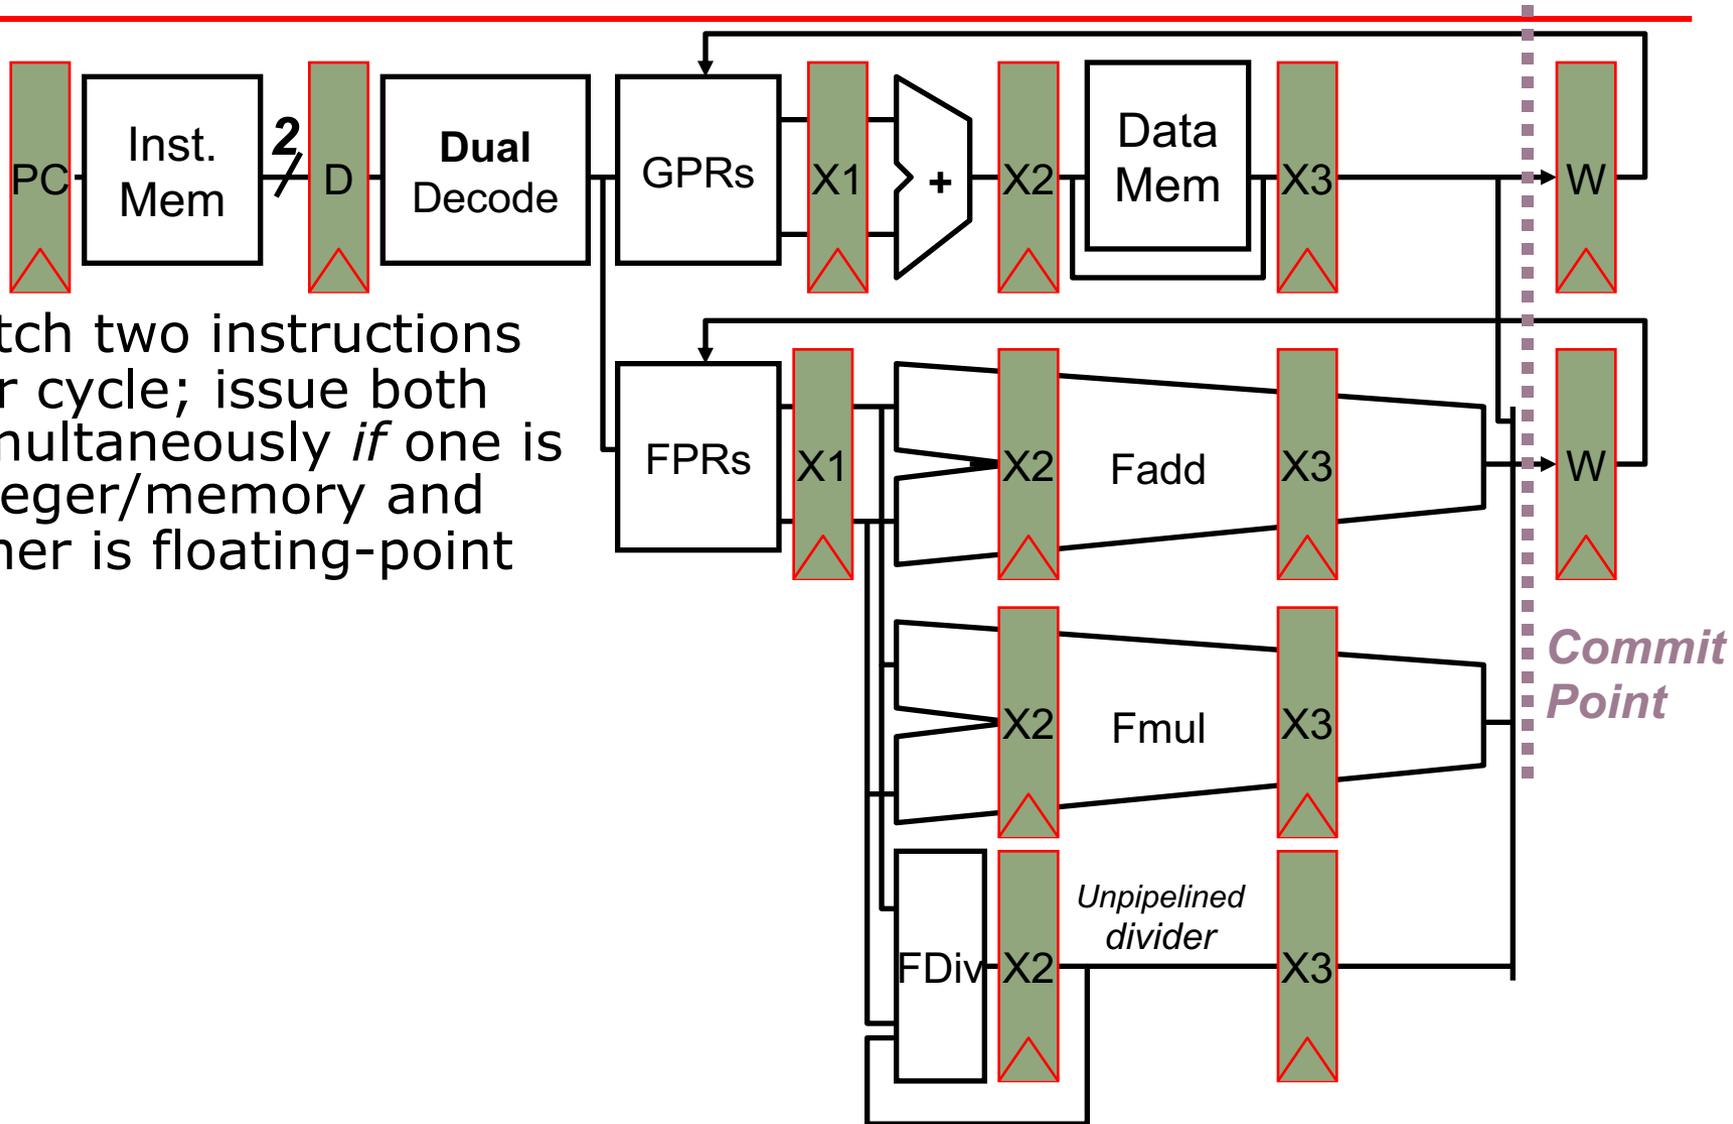

Exceptions?

Speculate that exceptions won't occur and detect them and recover in program order at commit point

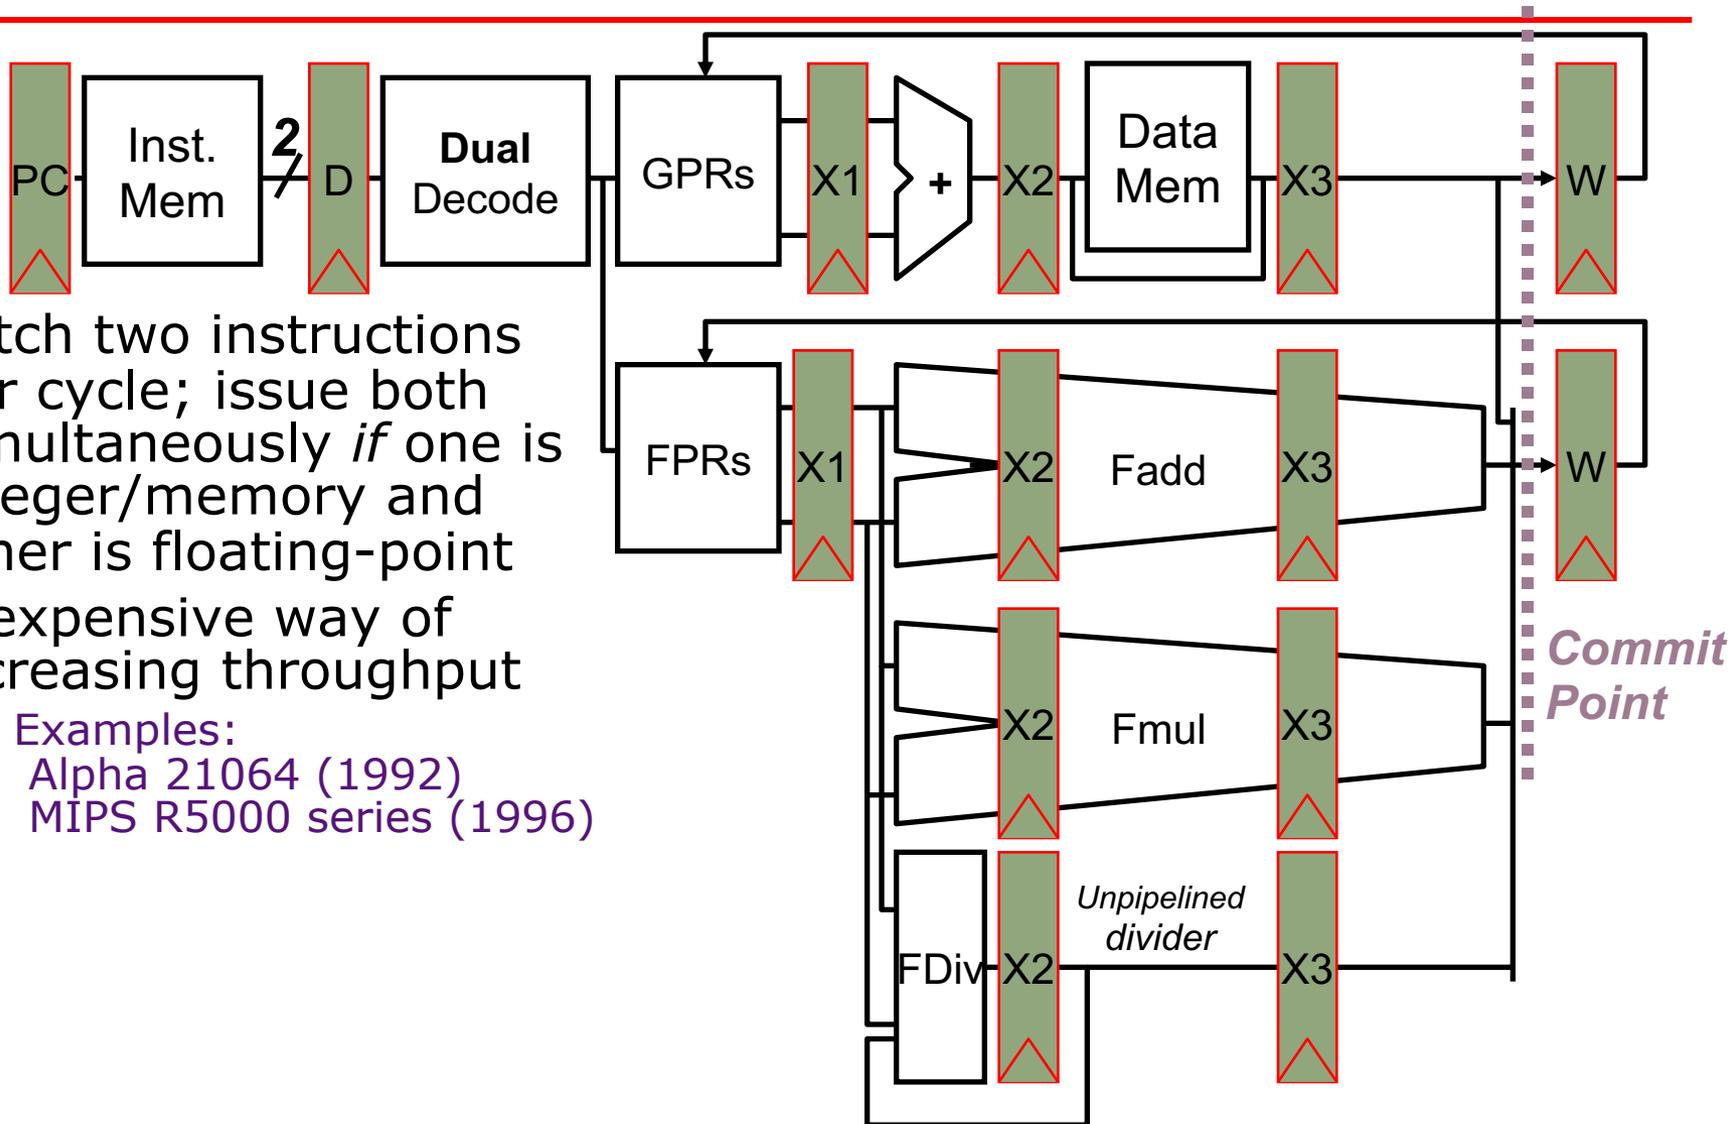

Commit Point

Superscalar In-Order Pipeline

- Fetch two instructions per cycle; issue both simultaneously *if* one is integer/memory and other is floating-point

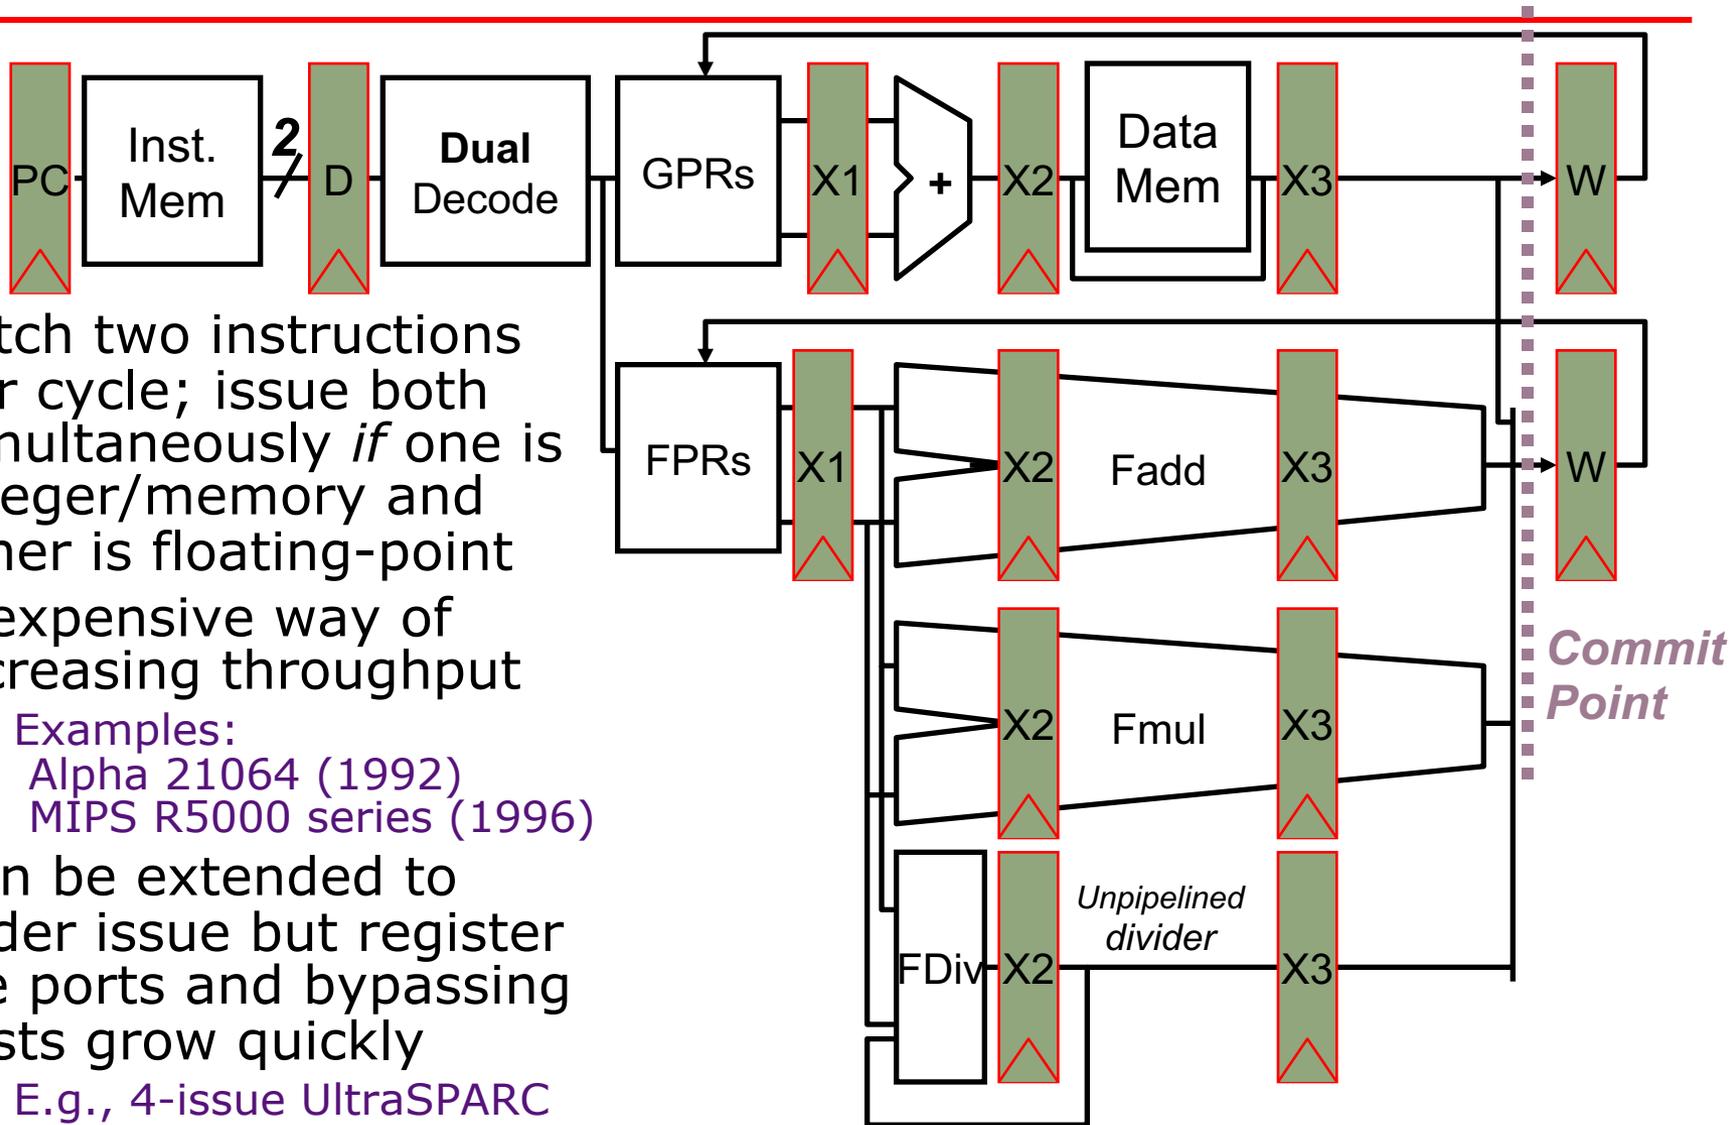

Superscalar In-Order Pipeline

- Fetch two instructions per cycle; issue both simultaneously *if* one is integer/memory and other is floating-point
- Inexpensive way of increasing throughput
 - Examples:
 - Alpha 21064 (1992)
 - MIPS R5000 series (1996)

Superscalar In-Order Pipeline

- Fetch two instructions per cycle; issue both simultaneously *if* one is integer/memory and other is floating-point
- Inexpensive way of increasing throughput
 - Examples:
 - Alpha 21064 (1992)
 - MIPS R5000 series (1996)
- Can be extended to wider issue but register file ports and bypassing costs grow quickly
 - E.g., 4-issue UltraSPARC

Dependence Analysis

Needed to Exploit Instruction-level Parallelism

Types of Data Hazards

Write-after-Write
(WAW) hazard

Detecting Data Hazards

Range and Domain of instruction i

$R(i)$ = Registers (or other storage) modified by instruction i

$D(i)$ = Registers (or other storage) read by instruction i

Detecting Data Hazards

Range and Domain of instruction i

$R(i)$ = Registers (or other storage) modified by instruction i

$D(i)$ = Registers (or other storage) read by instruction i

Suppose instruction j follows instruction i in the program order. Executing instruction j before the effect of instruction i has taken place can cause a

RAW hazard if $R(i) \cap D(j) \neq \emptyset$

WAR hazard if $D(i) \cap R(j) \neq \emptyset$

WAW hazard if $R(i) \cap R(j) \neq \emptyset$

Register vs. Memory Data Dependences

- Data hazards due to register operands can be determined at the decode stage *but*
- Data hazards due to memory operands can be determined only after computing the effective address

store $M[(r1) + disp1] \leftarrow (r2)$
load $r3 \leftarrow M[(r4) + disp2]$

Does $(r1) + disp1 == (r4) + disp2$?

Register vs. Memory Data Dependences

- Data hazards due to register operands can be determined at the decode stage *but*
- Data hazards due to memory operands can be determined only after computing the effective address

store $M[(r1) + disp1] \leftarrow (r2)$
load $r3 \leftarrow M[(r4) + disp2]$

Does $(r1) + disp1 == (r4) + disp2$?

A full lecture on how to handle memory dependency later.
This lecture: focuses on register dependency

Scoreboard: A Hardware Data Structure to Detect Hazards Dynamically

Complex Pipeline

When is it Safe to Issue an Instruction?

- Approach: Stall issue until sure that issuing will cause no dependence problems...
- Suppose a data structure keeps track of all the instructions in all the functional units
- The following checks need to be made before the Issue stage can dispatch an instruction
 - Is the required function unit available?
 - Is the input data available? \Rightarrow RAW?
 - Is it safe to write the destination? \Rightarrow WAR? WAW?
 - Is there a structural conflict at the WB stage?

WAR hazard? *NO: Operands read at issue*

WAW hazard? *YES: Out-of-order completion*

Simplifying the Data Structure

- No WAR hazard
⇒ no need to keep *src1* and *src2*

Simplifying the Data Structure

- No WAR hazard
⇒ no need to keep *src1* and *src2*
- The Issue stage does not dispatch an instruction in case of a WAW hazard
⇒ a register name can occur at most once in the *dest* column
Can be encoded as a bit vector

Scoreboard for In-order Issues

Busy[FU#] : a bit-vector to indicate FU's availability.
(FU = Int, Add, Mult, Div)

These bits are hardwired to FU's.

WP[reg#] : a bit-vector to record the registers for which writes are pending.

These bits are set to true by the Issue stage and set to false by the WB stage

Issue checks the instruction (opcode dest src1 src2) against the scoreboard (Busy & WP) to dispatch

FU available?

RAW?

WAR?

WAW?

Scoreboard for In-order Issues

Busy[FU#] : a bit-vector to indicate FU's availability.
(FU = Int, Add, Mult, Div)

These bits are hardwired to FU's.

WP[reg#] : a bit-vector to record the registers for which writes are pending.

These bits are set to true by the Issue stage and set to false by the WB stage

Issue checks the instruction (opcode dest src1 src2) against the scoreboard (Busy & WP) to dispatch

FU available?

Summary: CDC 6600-style Scoreboard

Summary: CDC 6600-style Scoreboard

Instructions are issued in order.

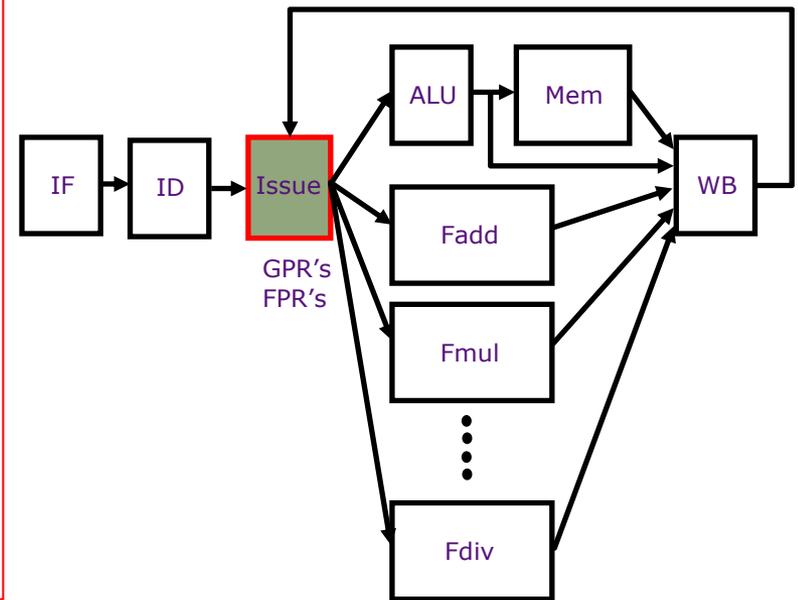

Summary: CDC 6600-style Scoreboard

Instructions are issued in order.

An instruction is issued only if

- It cannot cause a RAW hazard
 - It cannot cause a WAW hazard
- ⇒ There can be at most instruction in the execute phase that can write in a particular register*

Summary: CDC 6600-style Scoreboard

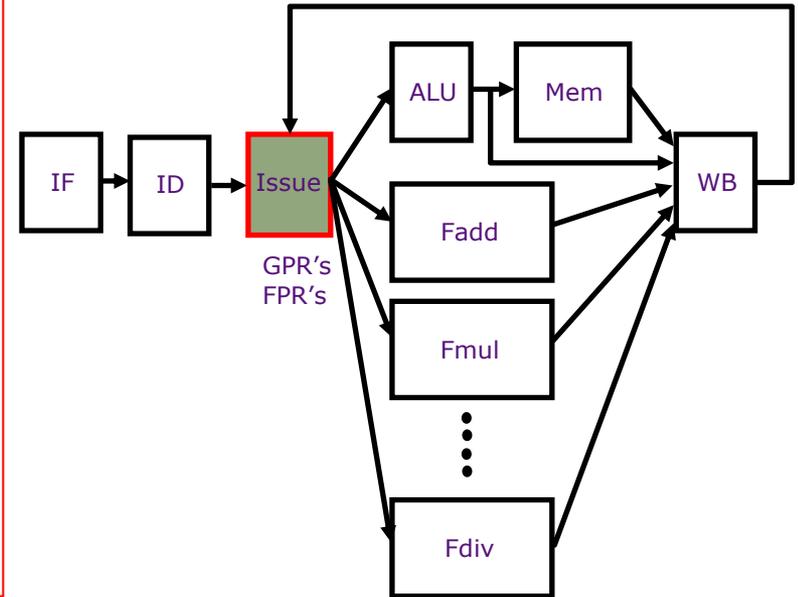

Instructions are issued in order.

An instruction is issued only if

- It cannot cause a RAW hazard
- It cannot cause a WAW hazard
⇒ There can be at most instruction in the execute phase that can write in a particular register

WAR hazards are not possible

- Due to in-order issue + operands read immediately

Summary: CDC 6600-style Scoreboard

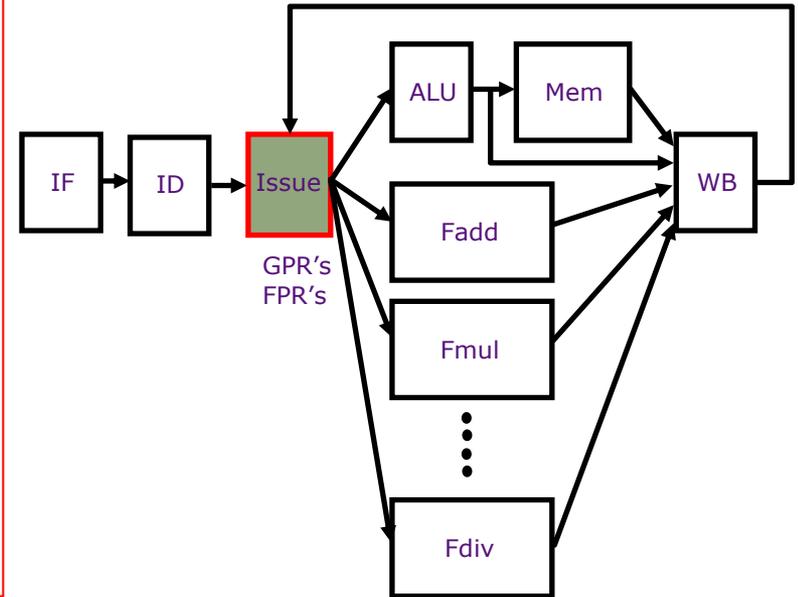

Instructions are issued in order.

An instruction is issued only if

- It cannot cause a RAW hazard
- It cannot cause a WAW hazard
⇒ There can be at most instruction in the execute phase that can write in a particular register

WAR hazards are not possible

- Due to in-order issue + operands read immediately

Scoreboard:
Two bit-vectors
